Abstract

Geophysical borehole logging has been performed in boreholes KFM08C, KFM10A, HFM30, HFM31, HFM33, HFM34, HFM35 and HFM38 all situated in Forsmark, Sweden.

The objective of the survey is to determine the physical properties of the rock mass around the borehole, e.g. to determine rock types and quantify the fracture frequency and localise deformation zones in the rock. Geophysical borehole logging was used to measure changes in physical properties in the borehole fluid and the bedrock surrounding the boreholes.

All boreholes were recorded from Top Of Casing (TOC). The logging in KFM08C was recorded to approximately 950 m, KFM10C was recorded to approximately 500 m, HFM30 was recorded to approximately 200 m, HFM31 was recorded to approximately 200 m, HFM33 was recorded to approximately 140 m, HFM34 was recorded to approximately 200 m, HFM35 was recorded to approximately 200 m and HFM38 was recorded to approximately 195 m.

The present report comprises a description of the applied equipment and the performed logging program, the fieldwork, data delivery and a presentation and discussion of the results.

Composite sheets of all the processed logs are included in Appendix 1–8.

Sammanfattning

Geofysisk borrhålsloggning har genomförts i borrhålen KFM08C, KFM10A, HFM30, HFM31, HFM33, HFM34, HFM35 och HFM38 i Forsmark.

Syftet med geofysisk borrhålsloggning är att bestämma bergets fysikaliska egenskaper för att bestämma bergartsfördelningen i det genomborrade bergpartiet samt att kvantifiera sprickfrekvensen och att lokalisera deformationszoner. Med geofysisk borrhålsloggning mäts bergets och borrhålsvattnets fysikaliska egenskaper i borrhålet och omgivande berg.

Den geofysiska borrhålsloggningen genomfördes i KFM08C från TOC (Top Of Casing, överkanten på det borrör som sticker upp över markytan) till ca 950 m, i KFM10A från TOC till ca 500 m, i HFM30 från TOC till ca 200 m, i HFM31 från TOC till ca 200 m, i HFM33 från TOC till ca 140 m, i HFM34 från TOC till ca 200 m, i HFM35 från TOC till ca 200 m och i HFM38 från TOC till ca 195 m.

Rapporten beskriver använd utrustning, genomfört loggningsprogram, fältarbete, leverans av data och en diskussion av resultatet.

Processerade loggar presenteras i Appendix 1–8.

1 Introduction

This document reports the results gained by the geophysical borehole logging in boreholes KFM08C, KFM10A, HFM30, HFM31, HFM33, HFM34, HFM35 and HFM38, which is one of the activities performed within the site investigation at Forsmark. The work was carried out in accordance with activity plan AP PF 400-06-050 (SKB internal controlling document). In Table 1-1 controlling documents for performing this activity are listed.

All measurements were conducted by RAMBØLL during the period June 6 to 8 and July 18 to 22, 2006. The boreholes were recorded from Top Of Casing (TOC) to the bottom of the boreholes. The location of the boreholes is shown in Figure 1-1. The technical data from the boreholes is shown in Table 1-2 and in Figure 1-2 to Figure 1-9.

The delivered raw and processed data have been inserted in the database of SKB (SICADA) and data are traceable by the activity plan number.

2 Objective and scope

The objective of the survey is to receive information of the borehole itself, and from the rock mass around the borehole. Geophysical borehole logging was used to measure changes in physical properties in the borehole fluid and the bedrock surrounding the boreholes. Acoustic televiewer was used for determination of the deviation of the borehole (azimuth and inclination) as well as to determine the length marks in the core-drilled boreholes, KFM08C and KFM10A.

This field report describes the equipment used as well as the measurement procedures. Geophysical borehole logging data is presented in graphs as a function of borehole length on drawings listed in Table 2-1.

Table 2-1. Appendix and drawing no.

Borehole	Drawing no.	Appendix
KFM08C	1.1	1
KFM10A	2.1	2
KFM30	3.1	3
KFM31	4.1	4
KFM33	5.1	5
KFM34	6.1	6
KFM35	7.1	7
KFM38	8.1	8

3 Equipment

The geophysical borehole logging program were performed with 7 multi tool probes and resulted in a suite of 16 log types, listed in Table 5-1 in Chapter 5. The tools and recorded logs are listed in Table 3-1.

Table 3-1. Logging tools and logs recorded.

Tool	Recorded logs	Dimension	Source detector spacing and type	Tool position in borehole	Tool used in borehole
Century 8144. Normal resistivity.	Normal resistivity (16 and 64 inch), single point resistance and natural gamma.	237 · 5.3 cm			All boreholes

4 Execution

4.1 General

In general the measurement procedures follow the SKB method description (MD 221.002, SKB internal controlling document). The logging program was executed in the period June 6 to 8 and July 18 to 22, 2006. All relevant logging events are described in the daily report sheets delivered to SICADA and are traceable by the activity plan number.

The fluid resistivity and temperature logs are recorded in downward direction, as the first log run. All other log types are recorded running the tool in upward direction in the borehole.

The applied logging equipment was calibrated and cleaned before arriving at the site according to SKB cleaning level 2 (SKB internal controlling document SKB MD 600.004). Furthermore, all equipment was wiped with alcohol before it was lowered into the borehole.

For control, each log run is normally recorded both in downward and in upward direction using the down run as a repeat section. For logging tool 9139 a repeated section is recorded in upward direction for control of the data. The position of the probe in the borehole is shown on both the recording computer and the winch. On the winch the tension of the cable is also shown. The winch will automatically stop, if the tension changes rapidly. The tension was recorded on all log runs using Century equipment, except for tool 9310.

All data was recorded with max.10 cm sample interval. The speed of the logging for the 9139 tool was 5 m/min, for the 8622 tool 20 m/min and for all other tools 10 m/min, except for the HiRAT Acoustic tool where the speed was 2 m/min in borehole KFM08C and KFM10A.

4.2 Nonconformities

The logging has been performed in accordance with the activity plan AP PF 400-06-050.

5 Results

5.1 Presentation

All relevant logging events were described in the daily report sheets, which were delivered separately.

The logs presented in Appendix 1–8 are presented in Table 5-1.

5.2 Orientation, alignment and stretch of logs

5.2.1 Orientation of images

The orientation of the results from the HiRAT Acoustic tool, are processed in the tool while recording, using the magnetometers and accelerometers in the tool.

5.2.2 Overlapping data

If the log data from one probe have been recorded in more than one file, the files are merged using events in both files. Overlapping in data is always used from the topmost-recorded file (overlapping data are never the mean value from two log runs).

Table 5-1. Logs presented in drawings no. 1.1 through 8.1 in Appendices 1 to 8.

Log	Log name short	Unit	Tool	Recorded/calculated in borehole
Fluid temperature	TEMP(FL)	Deg C	9042	All
Fluid resistivity	RES(FL)	Ohm-m	9042	All
Normal resistivity 16 inch	RES(16N)	Ohm-m	8144	All
Normal resistivity 64 inch	RES(64N)	Ohm-m	8144	All
Lateral resistivity	LATERAL	Ohm-m	8144	All
Single point resistance	SPR	Ohm	8144	All
Self potential	SP	mV	8144	All
Magnetic susceptibility	MAGSUSCEP	SI·10 ⁻⁵	8622	All
Caliper, 1-arm	CALIPER1	mm	9139	All
Gamma-gamma density	DENSITY	kg/m ³	9139	All
Focused guard log resistivity, 127 cm	RES(SG)	Ohm-m	9139	All
Natural gamma	GAM(NAT)	µR/h	9072	All
Focused guard log resistivity, 300 cm	RES(DG)	Ohm-m	9072	All
P-wave velocity	P-VEL	m/s	9310	All
Full wave form, near receiver	AMP(N)	µs	9310	All
Full wave form, far receiver	AMP(F)	µs	9310	All
Caliper, high resolution. 360°	CALIPER 3D	mm	HiRAT	All
High resolution 1D Caliper	CALIPER MEAN	mm	HiRAT	All
Borehole azimuth magnetic north	AZIMUTH MN	Deg	HIRAT	All
Borehole inclination from horizontal	DIP	Deg	HIRAT	All
360° orientated acoustic travel time	TRAVEL TIME	100 ns	HiRAT	All
360° orientated acoustic travel time	AMPLITUDE	—	HiRAT	All

5.2.3 Alignment of data

In order to obtain an exact length calibration, the track marks made while drilling are used. In boreholes without track marks, gamma events in the top and the bottom of the borehole are used. The connection between the track marks and the logs is obtained from the HiRAT Acoustic tool. The lengths from the track marks and from the HiRAT tool are used to make a new length scale in WellCAD. All log files are shifted using the new length scale.

5.2.4 Stretch of logs

There is a minor difference in the length registration between up- and down runs for the used winch. The size of the defect is about 1.5 m/km. To compensate for this the logs are stretched using another new length scale for each tool. The length scale is made by using gamma events from the tool compared with the same gamma events from the HiRAT tool. The events in both files are matched, and the new length scale is made and added to the log. The bottom of the borehole is considered in stretching the logs in case that no data will occur below the bottom of the borehole.

5.2.5 Removing of data

The processing of the data includes removing of spikes, negative and unrealistic values and data in the casing.

5.2.6 Repicking of sonic log

The sonic velocity is normally calculated using an automatic picking routine in the sonic tool, 9310. In inclined boreholes the routine is often picking the wrong arrivals, due to so-called “road noise”. Therefore the sonic logs have been manually re-picked in WellCAD using the full wave signal.

5.3 Calculated log curves

The different logs are calculated as described in Table 5-2.

5.3.1 Calculation of coordinates

To convert the measured azimuth and inclination to grid-coordinates, one needs to take into account the magnetic declination at the site at the time of data acquisition. The actual declination was found by means of the current International Geomagnetic Reference Field (IGRF). The actual values can be found below. Disturbances from solar storms etc were not taken into account. By means of the “Radius Of Curvature” method implemented in WellCad, the azimuth and inclination were converted to northing, easting and TVD coordinates relative to the top of the borehole. In the same calculation, the magnetic declination was added. Finally, the relative coordinates were added to the given coordinate in RT90 for the top of the borehole. The coordinates were calculated from 5 m below the casing bottom.

5.4 Borehole KFM08C

In order to obtain an exact length calibration in borehole KFM08C, the reference track marks made while drilling are used. The correlation between the track marks and the logs is obtained from the HiRAT Acoustic tool.

The reference track marks in the borehole and the recorded track marks from the HiRAT are observed at the length given in Table 5-3.

Table 5-2. Calculated log curves.

Log	Description of log calculation
Caliper, 1-arm	The Caliper was converted from [cm] to [mm] units by multiplying [cm] with 10.
Gamma-gamma density	The Gamma-gamma was converted from [g/cm ³] to [kg/m ³] units by multiplying with 1,000.
Focused guard log resistivity, 140 cm	–
Natural gamma	The natural gamma log was converted from CPS to μ R/h by multiplying the constant 0.077. This constant was computed from the logs previously performed in borehole KLX02 located in Oskarshamn.
Fluid temperature	–
Fluid resistivity	–
Normal resistivity 16 inch	–
Normal resistivity 64 inch	–
Lateral resistivity	–
Single point resistance	–
Self-potential	The SP value was converted from [mV] to [V] by dividing with 1,000
Focused guard log resistivity, 300 cm	–
P-wave velocity	The P-VEL velocity is calculated using the difference in distance between the far and near receiver divided by time difference between the first arrival from the far and near signal. (121.9 cm–91.4 cm)/(Time(far)–Time(near)).
Full wave form, near receiver	–
Full wave form, far receiver	–
Magnetic susceptibility	The magnetic susceptibility was converted for CGS units to SI units by multiplying the CGS value by 4π .
Caliper, high resolution. 360°.	The Caliper 3D is calculated using the acoustic travel time and the velocity in the borehole fluid. The velocity in the fluid is calculated using the fluid temperature and fluid conductivity.
CALIPER 3D	–
High resolution 1D Caliper	The Caliper mean is calculated using the mean travel time from the acoustic televiewer, the fluid temperature, fluid velocity and the internal travel time in the acoustic televiewer.
CALIPER MEAN	–
Borehole azimuth magnetic north	See 5.3.1
Borehole Inclination from lateral	See 5.3.1
360° orientated acoustic travel time	–
360° orientated acoustic amplitude	–

Table 5-3. The reference track marks in the borehole and the recorded track marks form the HiRAT in borehole KFM08C.

Reference mark	HiRAT recorded
102.23	102.23
150.00	150.131
200.00	200.267
250.00	250.328
300.00	300.435
350.00	350.565
398.00	398.688
450.00	450.802
600.00	601.28
750.00	751.627
800.00	801.822
850.00	851.92
900.00	902.12

To compensate for the difference between the reference track marks and the recorded track marks, the logs are stretched. The result from the stretching is a new length scale. The new length scale is applied to the HiRAT file. In this way a perfect match between given length of the reference marks and the recorded data is obtained. By means of alignment of the observed gamma events in KFM08C, between all log runs, the obtained reference mark correlation is transferred to the other logs.

The complete log suite for borehole KFM08C is presented as composite log sheets in drawing 1.1 in Appendix 1. The logs presented in drawing no. 1.1 are listed in Table 5-1.

5.5 Borehole KFM10A

In order to obtain an exact length calibration in borehole KFM10A, the reference track marks made while drilling are used. The correlation between the track marks and the logs is obtained from the HiRAT Acoustic tool.

The reference track marks in the borehole and the recorded track marks from the HiRAT are observed at the length values given in Table 5-4.

To compensate for the difference between the reference track marks and the recorded track marks the logs are stretched. The result from the stretching is a new length scale. The new length scale is applied to the HiRAT file. In this way a perfect match between given length values of the reference marks and the recorded data is obtained. By means of alignment of the observed gamma events in KFM10A, between all log runs, the obtained reference mark correlation is transferred to the other logs.

The complete log suite for borehole KFM10A is presented as composite log sheets in drawing 2.1 in Appendix 2. The logs presented in drawing no. 2.1 are listed in Table 5-1.

5.6 Borehole HFM30

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM30 is presented as composite log sheets in drawing 3.1 in Appendix 3. The logs presented in drawing no. 3.1 are listed in Table 5-1.

Table 5-4. The reference track marks in the borehole and the recorded track marks form the HiRAT in borehole KFM10A.

Reference mark	HiRAT recorded
100.00	100
150.00	150.12
200.00	200.25
250.00	250.371
300.00	300.477
350.00	350.,572
400.00	400.735
450.00	450.825

5.7 Borehole HFM31

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM31 is presented as composite log sheet in drawing no. 4.1 in Appendix 4. The logs presented in drawing no. 4.1 are listed in Table 5-1.

5.8 Borehole HFM33

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM33 is presented as composite log sheet in drawing no. 5.1 in Appendix 5. The logs presented in drawing no. 5.1 are listed in Table 5-1.

5.9 Borehole HFM34

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM34 is presented as composite log sheet in drawing no. 6.1 in Appendix 6. The logs presented in drawing no. 6.1 are listed in Table 5-1.

5.10 Borehole HFM35

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM35 is presented as composite log sheet in drawing no. 7.1 in Appendix 7. The logs presented in drawing no. 7.1 are listed in Table 5-1.

5.11 Borehole HFM38

Using the natural gamma from the 9042 as reference, the natural gamma logs from the other probes are aligned to the same length. A new length scale is added to each log and afterwards the logs are stretched using different gamma events.

The complete log suite for borehole HFM38 is presented as composite log sheet in drawing no. 8.1 in Appendix 8. The logs presented in drawing no. 8.1 are listed in Table 5-1.

6 Data delivery

The geophysical logging data, recorded in Century and Robertson format, were delivered directly after the termination of the field activities. The recorded data files used in the processing have also been delivered in WellCAD format, Table 6-1.

The delivered data have been inserted in the database (SICADA) of SKB and are traceable by the activity plan number.

The processed files shown on the drawings have been delivered in WellCAD, Table 6-2, and as EXCEL-files (one for each borehole) in SICADA format, Table 6-3.

Table 6-1. Recorded log files in Century or Robertson format used for processing.

Appendix 4

Borehole HFM31. Drawing no. 4.1. Borehole logs

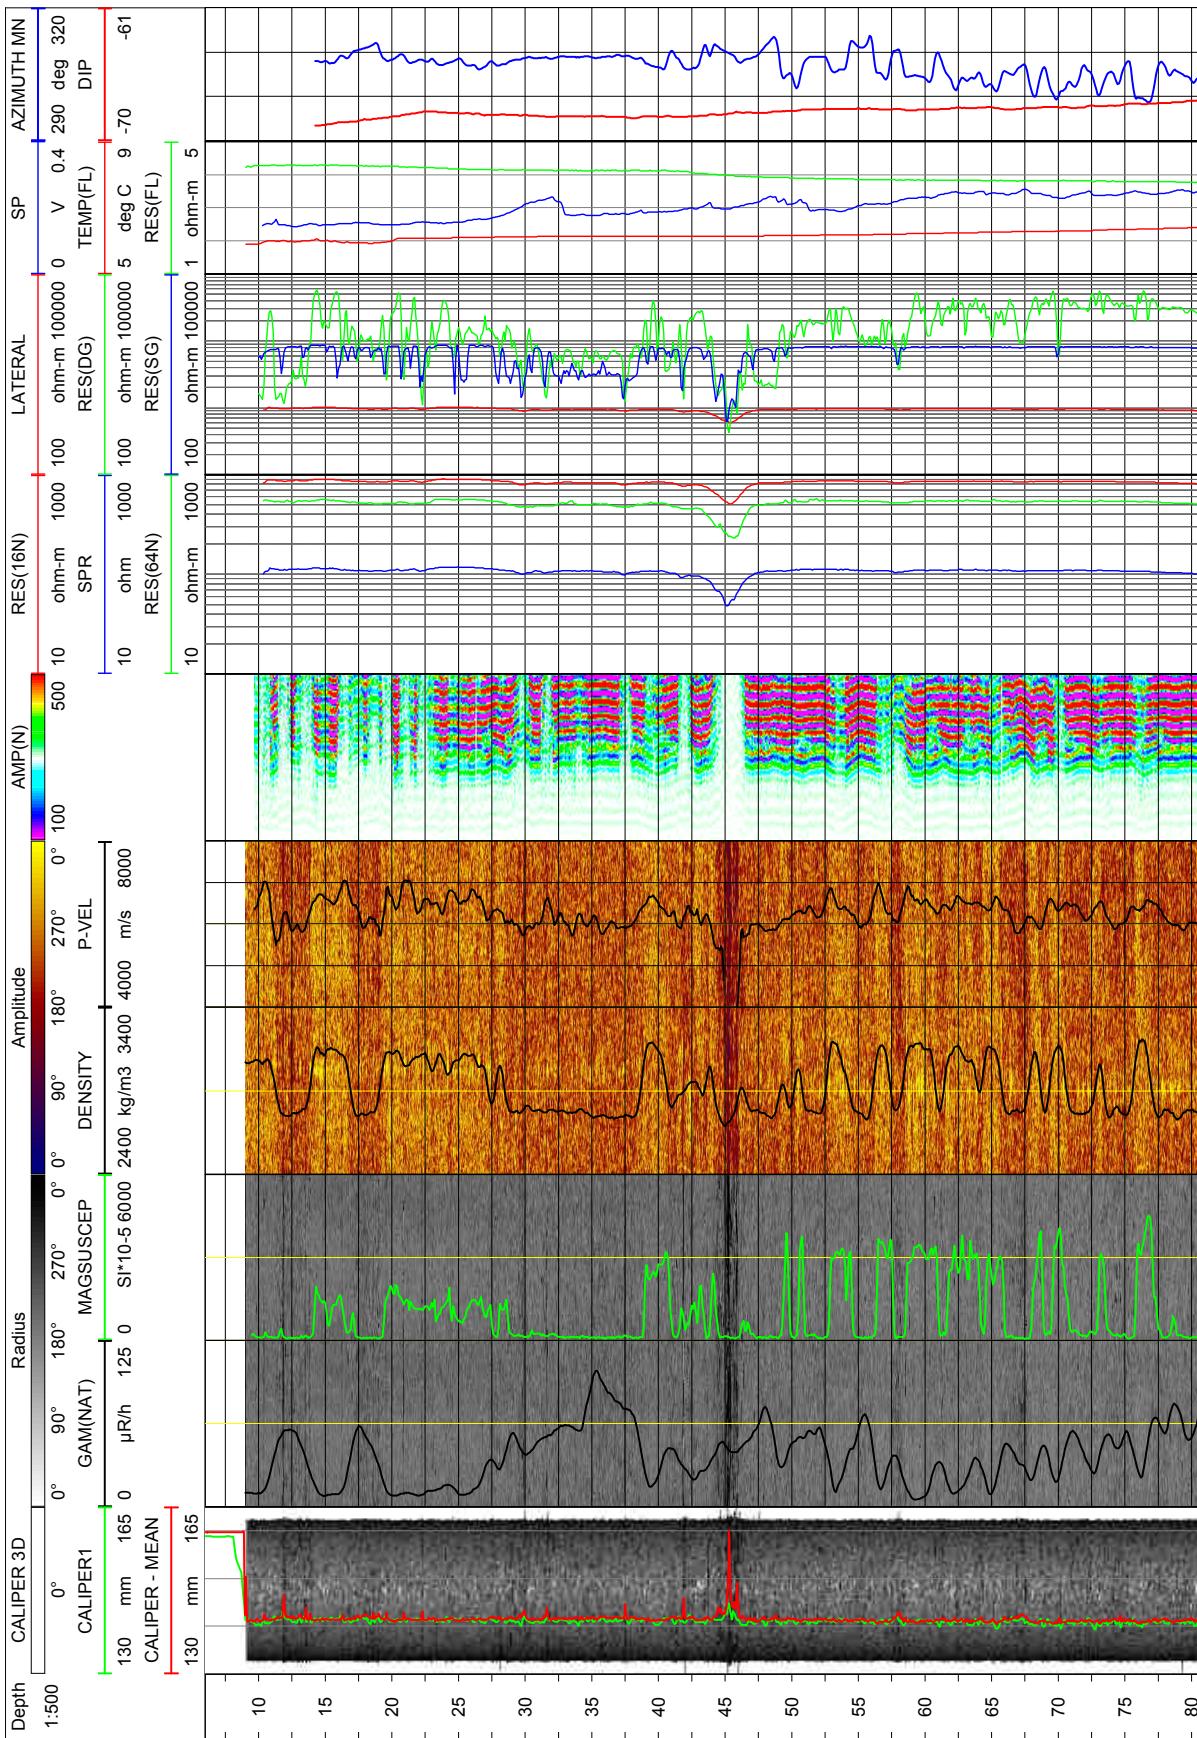

Co-ordinates in RT90 2,5 gon V 0:-15
 Northing: 6700860.439m Easting: 1629207.283m Elevation: 6.069m, RHB70

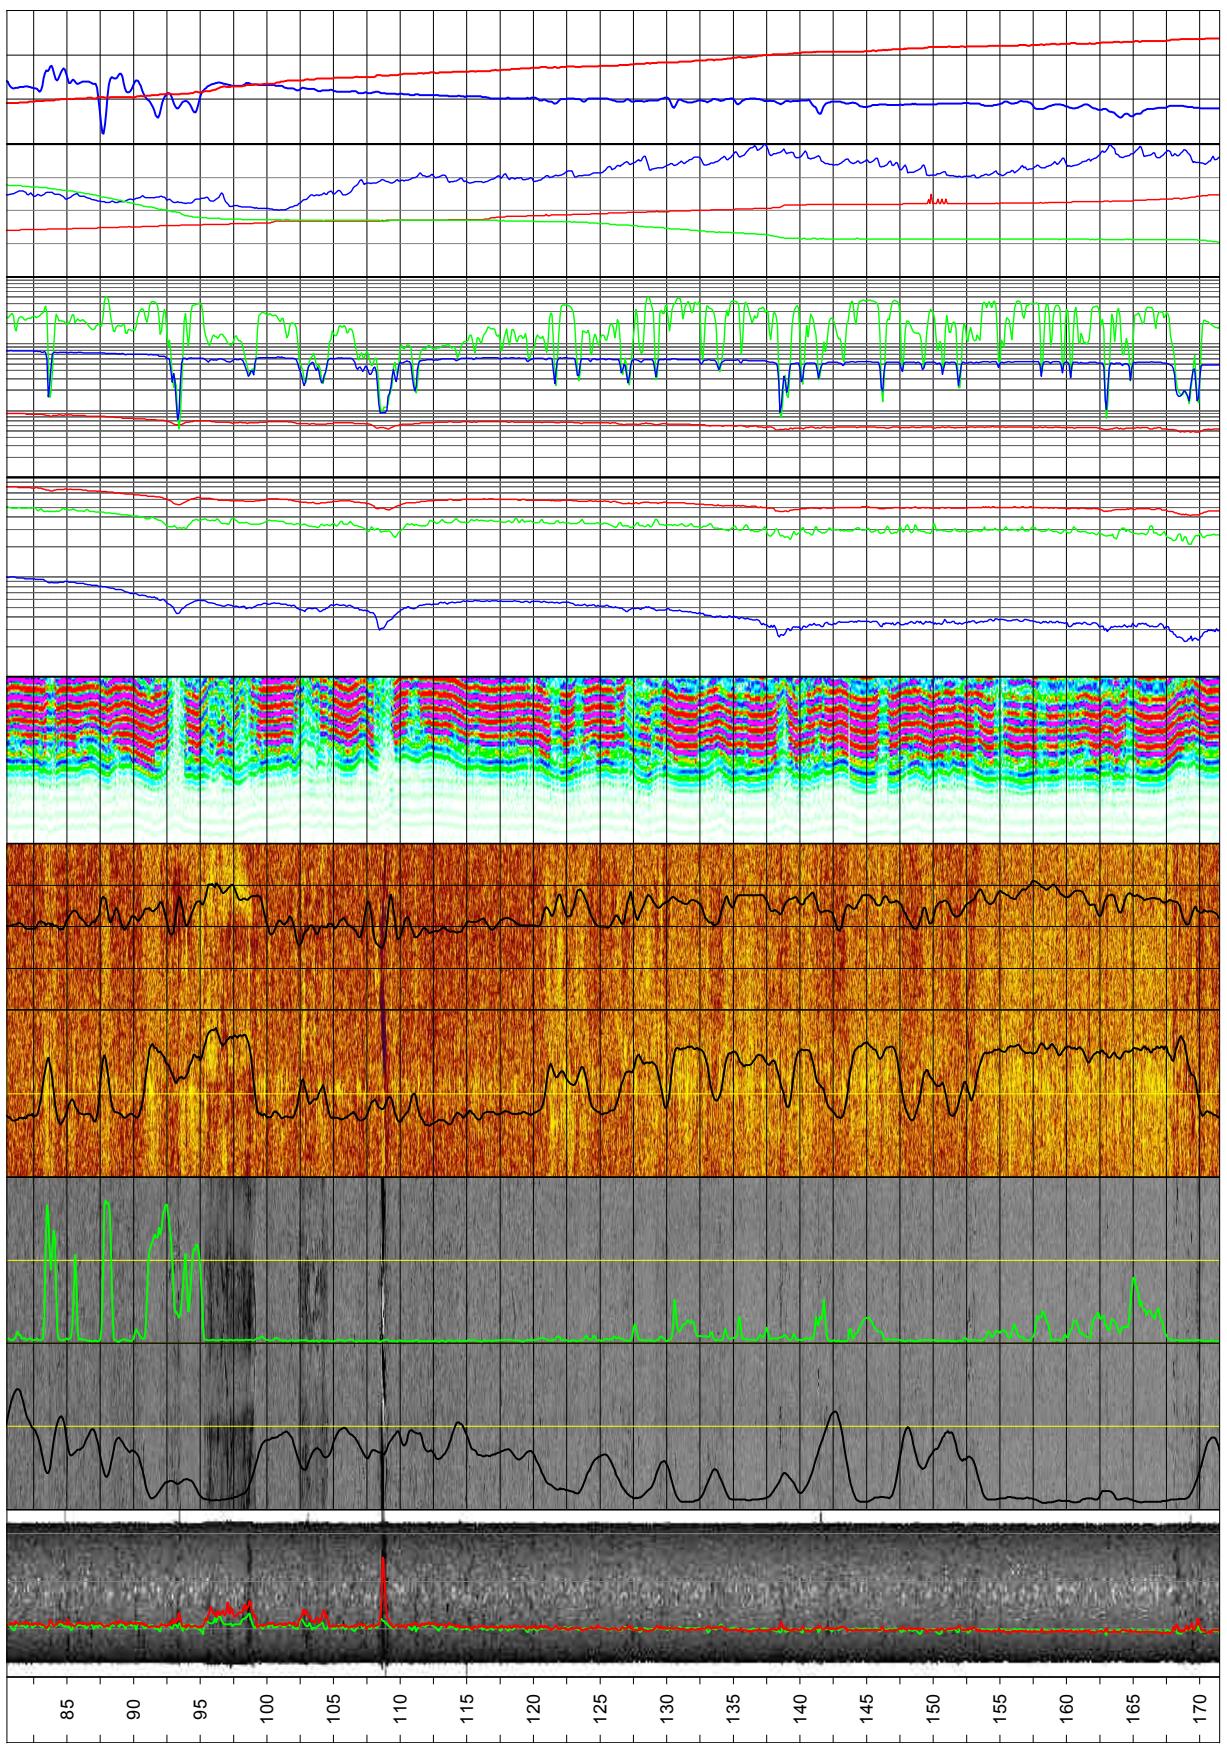

Diameter: 138.5-140.9mm
 Reaming Diameter:
 Outer Casing: 168mm
 Inner Casing: 160mm
 Borehole Length: 200.75m
 Cone:
 Inclination at ground surface: -69.23°
 Azimuth: 311,80°GN
 Comments:

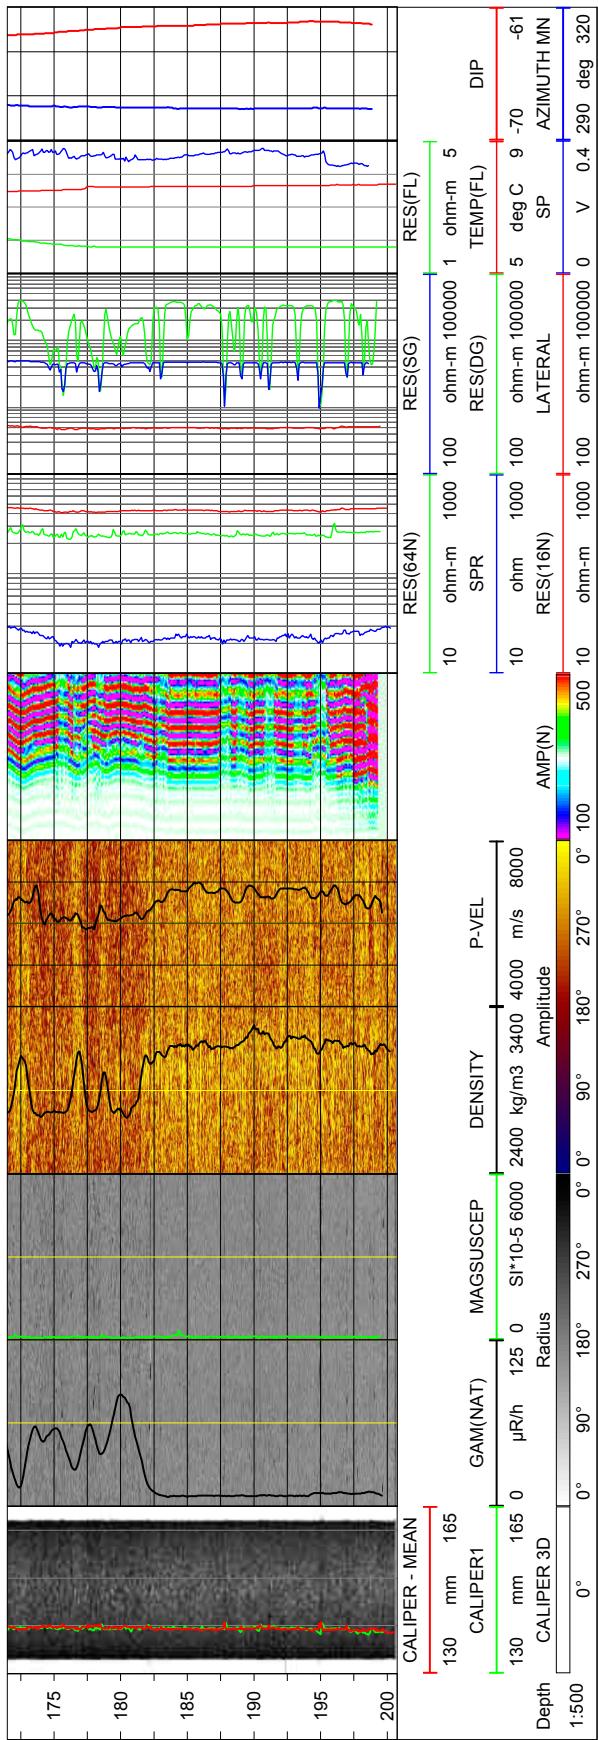

Borehole logging programme

Name	Description	Tool	Unit
CALIPER1	Caliper, 1-arm	9139	mm
DENSITY	Gamma-gamma density	9139	kg/m³
RES(SG)	Focused guard log resistivity, 128 cm	9139	ohm-m
GAM(NAT)	Natural gamma	9072	µR/h
TEMP(FL)	Fluid temperature	9042	deg C
RES(FL)	Fluid resistivity	9042	ohm-m
RES(DG)	Focused guard log resistivity, 300cm	9072	ohm-m
P-VEL	P-wave velocity	9310	m/s
AMP(N)	Full wave form, near receiver	9310	µs
AMP(F)	Full wave form, far receiver	9310	µs
MAGSUSCEP	Magnetic susceptibility	8622	SI*10-5
CALIPER 3D	Caliper, high resolution 360 degrees	HIRAT	mm
CALIPER MEAN	High resolution 1D caliper	HIRAT	mm
AZIMUTH MN	Borehole azimuth magnetic north	HIRAT	deg
DIP	Borehole inclination from horizontal	HIRAT	deg
RADIUS	360 degrees orientated acoustic radius	HIRAT	mm
AMPLITUDE	360 degrees orientated acoustic amplitude	HIRAT	-
THORIUM	Spectral gamma, Thorium component	9080	PPM
URANIUM	Spectral gamma, Uranium component	9080	PPM
POTASSIUM	Spectral gamma, Potassium component	9080	percent
RES(16N)	Normal resistivity 16 inch	8144	ohm-m
RES(64N)	Normal resistivity 64 inch	8144	ohm-m
LATERAL	Lateral resistivity	8144	ohm-m
SPR	Single point resistivity	8144	ohm
SP	Self Potential	8144	V
