## **Abstract**

The objective of the investigation was to estimate biological production and respiration within the soil and ground layer of seven different vegetation types in the Forsmark area. The seven types were two types of spruce forests, a pasture, a deciduous forest, a 15–20 years old clear-cut, a mire and a forested wetland. The field measurements were done with a closed chamber attached to an environmental gas monitor for carbon dioxide. Soil temperature at 10 cm depth, soil moisture, air temperature, air concentration of carbon dioxide and photosynthetic active radiation (PAR) were also measured.

Production measurements were performed in daylight, and respiration measurements were achieved by placing a black bucket over the transparent chamber in order to prevent radiation to reach the vegetation. The measurements started in spring 2005 at four of the locations and in late October 2005 at the remaining three locations. The obtained data will be used in an ecosystem model of the Forsmark area, which is part of the site description.

## **Sammanfattning**

Syftet med undersökningen var att mäta produktion och respiration i mark och markskikt i sju olika vegetationstyper i Forsmarksområdet. De sju vegetationstyperna utgjordes av två olika granskogar, en gräsmark, en lövskog, ett 15–20 år gammalt hygge med tallskog, en våtmark och en sumpskog.

Mätningarna gjordes i en sluten kammare förbunden med en infraröd koldioxidmätare. Förutom halten koldioxid mättes också lufttemperatur, marktemperatur, markfuktighet och solinstålning i form av PAR (strålning inom spektret 400–700 nm, utnyttjas vid fotosyntesen).

Mätning av produktion genomfördes i dagsljus och mätning av respiration i mörker. Mörker åstadkoms genom att en svart hink placerades över den genomskinliga mätkammaren. Mätningarna påbörjades våren 2005 vid fyra av lokalerna och sent i oktober för resterande tre lokaler. Resultatet från mätningarna kommer att användas i en ekosystemmodell för Forsmarksområdet, vilket är en del av platsbeskrivningen för Forsmark.

# 1 Introduction

This document reports the data gained in “Ground respiration measurements”, which is one of the activities performed within the site investigation at Forsmark. The work was carried out in accordance with activity plan AP PF 400-05-041. In Table 1-1 controlling documents for performing this activity are listed. Both activity plan and method descriptions are normally SKB’s internal controlling documents. In this case though, the description of the method that was used is found in an externally available report.

Measurements of ground respiration, net ecosystem exchange of carbon dioxide (NEE) and gross primary production (GPP) have been carried out within seven different vegetation types (plant functional type, pft) during approximately one year. At each measurement point the ground moisture was measured also, as there might be a relationship between soil moisture and ground respiration. The different vegetation types where measurements were carried out are presented in Table 1-2 and the locations of the measurement areas are shown in the map in Figure 1-1.

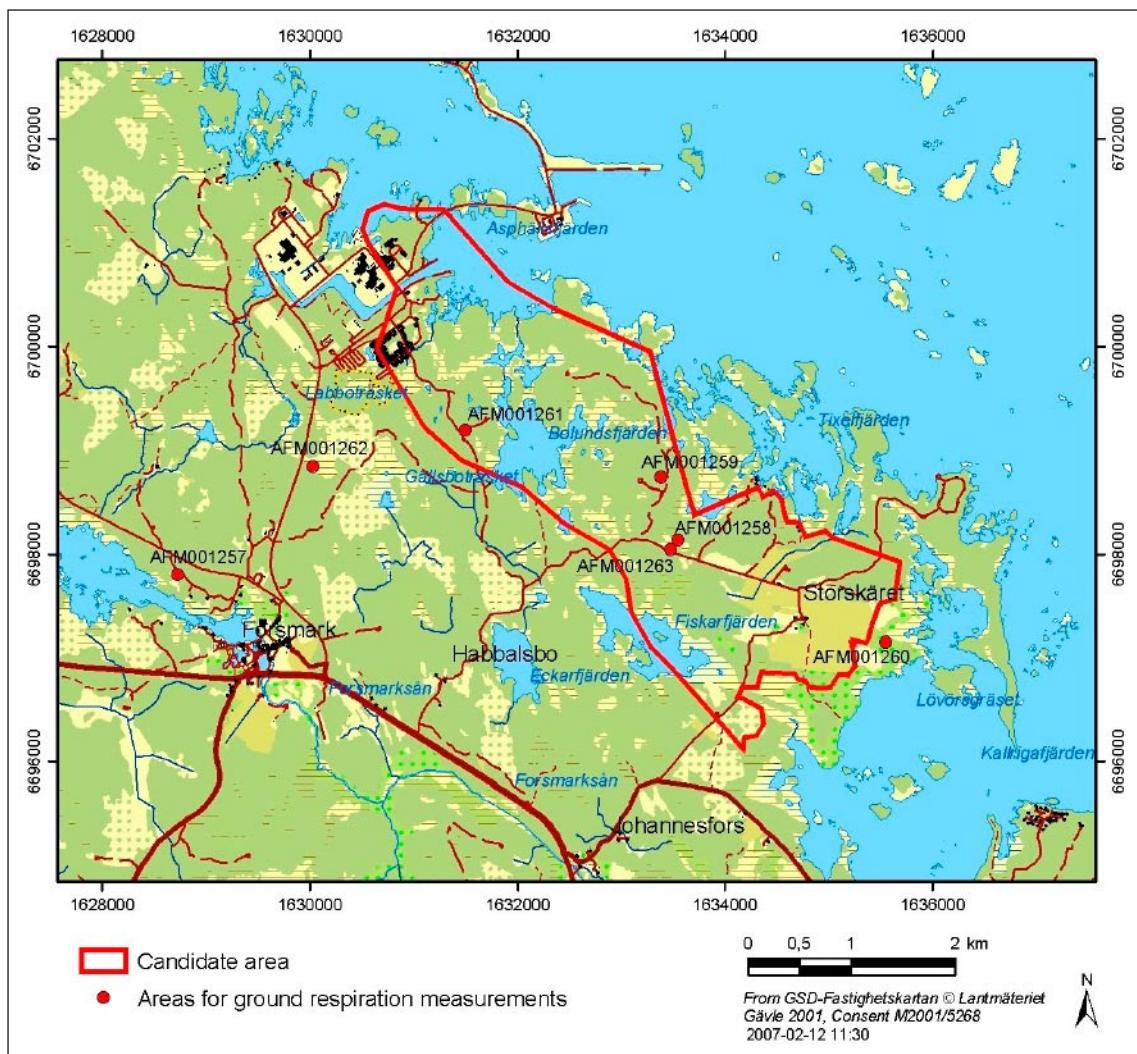

The original results are stored in the primary data base, SICADA, and are traceable by the activity plan number, AP PF 400-05-041.

## **2      Objective and scope**

This activity was conducted in order to obtain data about ground respiration, net ecosystem exchange of carbon dioxide and gross primary production within seven different vegetation types in the Forsmark area. The data will be used in ecological model calculations. At four of the locations the measurements started during spring 2005 and at the remaining three during the winter of 2005/2006. The measurements were completed in late October 2006, covering all four seasons at all locations.

### 3 Equipment

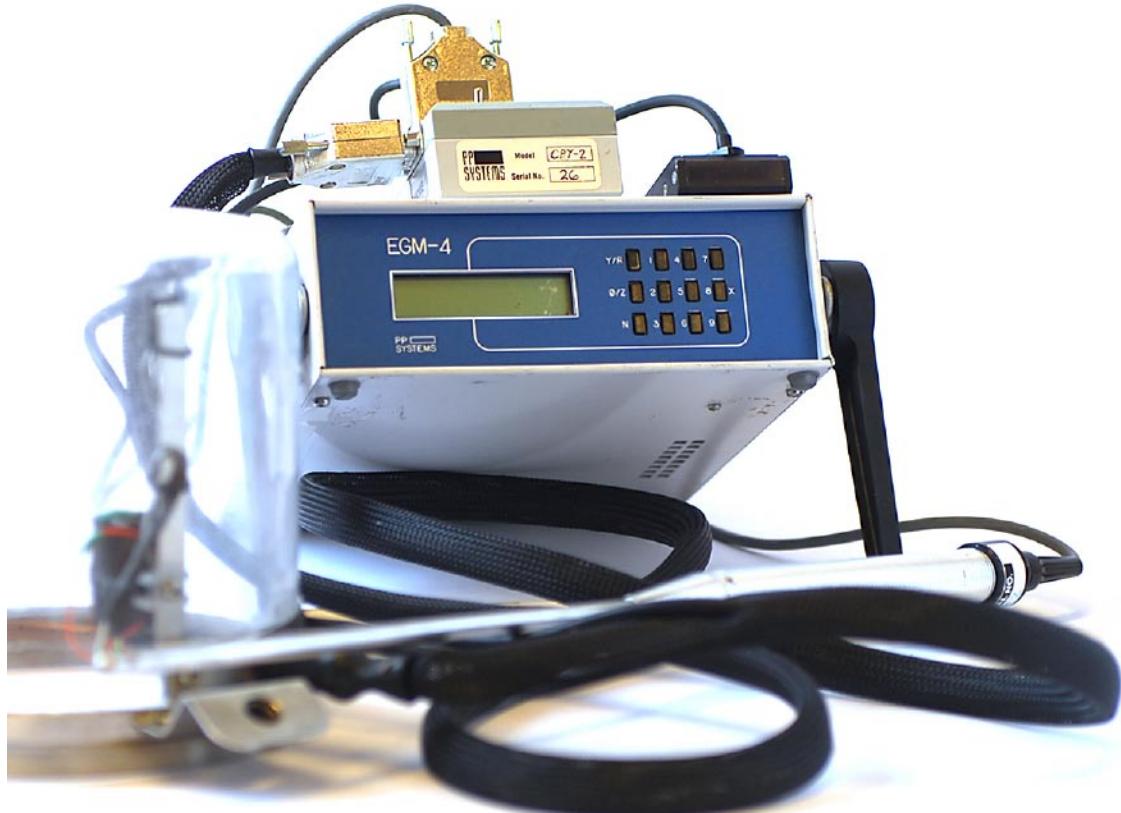

#### 3.1 Equipment for ground respiration measurement

To measure the ground respiration and net ecosystem exchange of carbon dioxide an infrared environmental gas monitor, EGM-4, from PP-Systems was used. The measurement equipment consists of a transparent cylindrical assimilation chamber, CPY-2, with a defined volume and cross-section area, a ground temperature measurement probe and an infrared gas analyser.

The CPY-2 chamber is provided with a light sensor measuring photosynthetic active light as PAR ( $\mu\text{mol m}^{-2} \text{ sec}^{-1}$ ). The instrument also measures air temperature within the chamber. Air from the chamber is transported to the EGM-4 via rubber tubes, and the EGM-4 uses infrared light to analyse CO<sub>2</sub> concentration (gases such as CO<sub>2</sub> absorb photons in the infrared range). The EGM-4 also registers atmospheric pressure and atmospheric carbon dioxide concentration. The measurement equipment is shown in Figure 3-1.

To be able to perform measurements at wet locations (e.g. the forested wetland and the mire) an extension tube was used on the assimilation chamber to prevent water from entering the gas analyser.

Data are stored in the EGM-4 and easily transferred to a computer. The Operator's manual for EGM-4, version 4.13, 2003, was used.

**Figure 3-1.** Infrared Environmental Gas Monitor, EGM-4, with assimilation chamber and ground temperature probe.

### 3.2 Equipment for soil moisture measurement

To measure the soil moisture a moisture meter, HH2 with a ML2x probe, from Delta-T Devices was used, see Figure 3-2. At each measurement point for ground respiration measurements, the soil moisture was measured in three different points and the mean value was calculated and used. The moisture meter was set to organic soil.

*Figure 3-2. Moisture meter HH2 with ML2x probe used for ground respiration measurements.*

## **4 Execution**

### **4.1 General**

The investigation comprised measurements of ground respiration, production and net ecosystem exchange of carbon dioxide at seven different ecosystems in the Forsmark site investigation area. The measurements were carried out between May 2005 and October 2006.

The measurement areas were roughly 30×30 m. In each area, there were nine fixed points where measurements were conducted. The point were randomly placed within the measurement area, except at the forested wetland, using the randomize function in Microsoft Excel for the coordinates. The points were then placed in the field by using a GPS-reciever and marked with a wooden stick. Each measurement point was given a unique ID corresponding to the area in question. At the forested wetland ten fixed points were placed within the measurement area, of which five were placed in dry areas and the other five in wet areas. The measurement points in dry areas were in this case given numbers 60–64 and those in wet areas 65–69.

At each point two measurements were made, one in daylight and one in darkness to measure production and respiration respectively. To achieve darkness, a black plastic bucket was placed over the assimilation chamber so that no photoactive light reached the vegetation in the chamber.

In addition to the parameters registered by the EGM-4 instrument, the ground moisture was measured at each point. This was made using a moisture meter. At each point the ground moisture was measured in three different spots and then a mean value was calculated and used.

After each field session, data from the instrument were transferred from the instrument to a computer, and then transferred to SKB's database SICADA. The ground moisture data were manually transferred from the field protocol to a database template. Data are traceable in SICADA by the activity plan number, AP PF 400-05-041.

### **4.2 Notes about the instruments**

Some specific notes about the instruments are worth mentioning. The EGM-4 internal battery was charged before each measuring period. During winter and cold weather the battery needed charging after measuring one, or maximum two areas.

Normally the maximum measurement time was set to two minutes, or to finish when the concentration of CO<sub>2</sub> had changed with more than 400 ppm. During winter and at wet locations, e.g. water covering the ground, the maximum measurement time was set to four minutes.

The EGM-4 was set up to record only the last measured value. In some cases though, the instrument was set up to record all values, e.g. during some winter measurements and when measuring on water covered ground. In those cases, normally the end value was used.

The EGM-4 is sensible to moist and hence, it was never placed directly on the ground, and measurements were avoided in rainy or moist weather.

The CPY-2 chamber is also sensible to moist, and when the chamber got wet inside, the instrument did not record data in a correct way. In those cases, the chamber needed to be carefully dried with a towel or paper before measuring again. For measurements at moist and wet locations an extension tube was used on the chamber. On those occasions the reference volume of the chamber needed to be recalculated and entered into the EGM-4 before conducting the measurement to achieve correct results.

The HH2 moisture meter has different soil-type settings, e.g. one for organic soil and one for mineral soil. By mistake, the first measurements were made using the mineral soil-type setting. This was discovered after a while and the setting was changed. Previously measurements could be corrected using the conversion formula:

$$\text{Ground moisture}_{\text{organic}} = 0.039 + 1.091 \cdot \text{ground moisture}_{\text{mineral}}$$

### 4.3 Execution of field work

In the field, the instruments were connected and prepared according to the manual. After identifying the plot to be measured, the chamber was placed on the ground. The first measurement at each measurement point was done in daylight, and the second (at the same point) was made in dark conditions. To achieve darkness, a black plastic bucket was placed over the chamber so that no photoactive light would reach the vegetation inside the chamber.

Each measurement took approximately 2 minutes, which means roughly 4 minutes at each point. There were some handling time between the measurements, e.g. between measuring in light and dark, and before starting at a new point the chamber was held in the air, the fans inside flushed the chamber and it self-calibrated. In total, measuring at one area took roughly 60–90 minutes. Measurements of ground moisture were normally made during the production measurements at each point.

### 4.4 Data handling

The data were recorded in the EGM-4 in the field. The instrument is able to store 1,000 values. Normally the data were transferred to a computer after measuring 2–3 areas. The transferred data were controlled using the transferring software before converted to MS Excel format. The raw data files were stored and are traceable by the activity plan number, AP PF 400-05-041.

The data were converted to MS Excel data and then controls were made to ensure that all data had been converted and transferred, before the data in the instrument were deleted. After each field session, the data were copied into the SICADA template.

Ground moisture data were manually transferred from the field protocol to the SICADA template, where the mean values were calculated.

### 4.5 Nonconformities

The earlier mentioned sensitivity for moist (both EGM-4 and CPY-2) might have affected the results. The message “non-linear fit” now and then was displayed under moist conditions, but after drying the chamber, we did not meet any difficulties with the measuring procedure.

The measurements of respiration and production on wet locations were not introduced until October 2005 due to technical development of the equipment, e.g. the construction of the extension tube that was used to prevent water from entering the instrument.

At the first measurements of soil moisture, the choice of device setting for soil type was mineral soil by mistake. When this was discovered, the setting was changed and the previously recorded results were recalculated. A conversion formula was developed by Torbern Tagesson at the university of Lund. The conversion formula used was:

$$\text{Ground moisture}_{\text{organic}} = 0.039 + 1.091 \cdot \text{ground moisture}_{\text{mineral}}$$

Due to ground frost or ice, ground moisture measurements were not possible to carry out at a couple of occasions. The same is valid for those occasions when the ground was covered with water at the measurement point.

## **5      Results**

The results from this activity are presented in Appendix 1–2. No diagrams or other interpretations are presented in this report.

Original data from the reported activity are stored in the primary database SICADA. The data are traceable in SICADA by the activity plan number (AP PF 400-05-041). Only data in the databases are accepted for further interpretation and modelling. Data presented in this report are regarded as copies of the original data. Data in the databases may be revised, if needed. However, such revision of the database will not necessarily result in a revision of this report.
