This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the authors and do not necessarily coincide with those of the client.

Data in SKB's database can be changed for different reasons. Minor changes in SKB's database will not necessarily result in a revised report. Data revisions may also be presented as supplements, available at www.skb.se.

A pdf version of this document can be downloaded from www.skb.se.

Abstract

This report summarises water sampling from eleven sections in permanently installed core-drilled boreholes; KAV01:3, KLX01:3, KLX02:2, KLX02:5, KLX06:3, KLX06:6, KLX07A:2, KSH01A:4, KSH01A:7, KSH02:1 and KSH02:4, within the site investigation programme at Oskarshamn. The water sampling performed in the monitoring programme is repeated twice every year and this report summarises results from the first sampling occasion 2006. The objective is to determine the groundwater composition in the sections instrumented for this purpose.

The results from this activity include groundwater chemistry data in accordance with SKB class 5 chemistry for all of the borehole sections above. The data were obtained during June and July 2006.

All analytical data from the activity are stored in the SICADA database.

(Some of the results from the second sampling occasion 2006 are presented in Appendix 2. A complete report is planned during 2007.)

Sammanfattning

Denna rapport sammanfattar vattenprovtagning från elva sektioner i de permanent installerade kärnborrhålen KAV01:3, KLX01:3, KLX02:2, KLX02:5, KLX06:3, KLX06:6, KLX07A:2, KSH01A:4, KSH01A:7, KSH02:1 och KSH02:4 inom platsundersökningen i Oskarshamn. Provtagningen utförs två gånger per år och denna rapport sammanfattar resultaten från den första omgången 2006. Syftet är att bestämma grundvattensammansättningen i samtliga för ändamålet instrumenterade borrhålssektioner.

Resultaten från denna aktivitet inkluderar vattenkemidata enligt SKB kemiklass 5 från alla sektioner ovan. Proverna är tagna under juni och juli 2006.

Alla resultat från vattenanalyserna finns i databasen SICADA.

(En del av resultaten från den andra provtagningsomgången 2006 finns med i Appendix 2. Fullständig rapport kommer under 2007.)

1 Introduction

This document reports data collected within the Hydrochemical monitoring programme for core drilled boreholes 2006, which is one of the activities performed within the site investigation at Oskarshamn. The work was carried out in accordance with activity plan AP PS 400-06-060. Controlling documents for performing this activity are listed in Table 1-1. The activity plan and method description are SKB internal controlling documents. The field work was performed during June to July 2006 and is reported in the database SICADA, traceable using the activity plan number.

The activity includes water sampling from boreholes (Table 1-2) according to SKB chemistry class 5 including options of trace elements and the isotopes $\delta^{34}\text{S}$, $\delta^{37}\text{Cl}$, $^{87}\text{Sr}/^{86}\text{Sr}$, $^{10}\text{B}/^{11}\text{B}$, ^{14}C , ^{13}C , ^{226}Ra , ^{222}Rn , ^{238}U , ^{234}U and ^{230}Th . Determination of density and field measurements of pH and temperature were also performed. Archive samples were stored in a freezer. A map showing the investigation site at Oskarshamn is presented in Figure 1-1.

Table 1-1. Controlling documents for the performance of the activity.

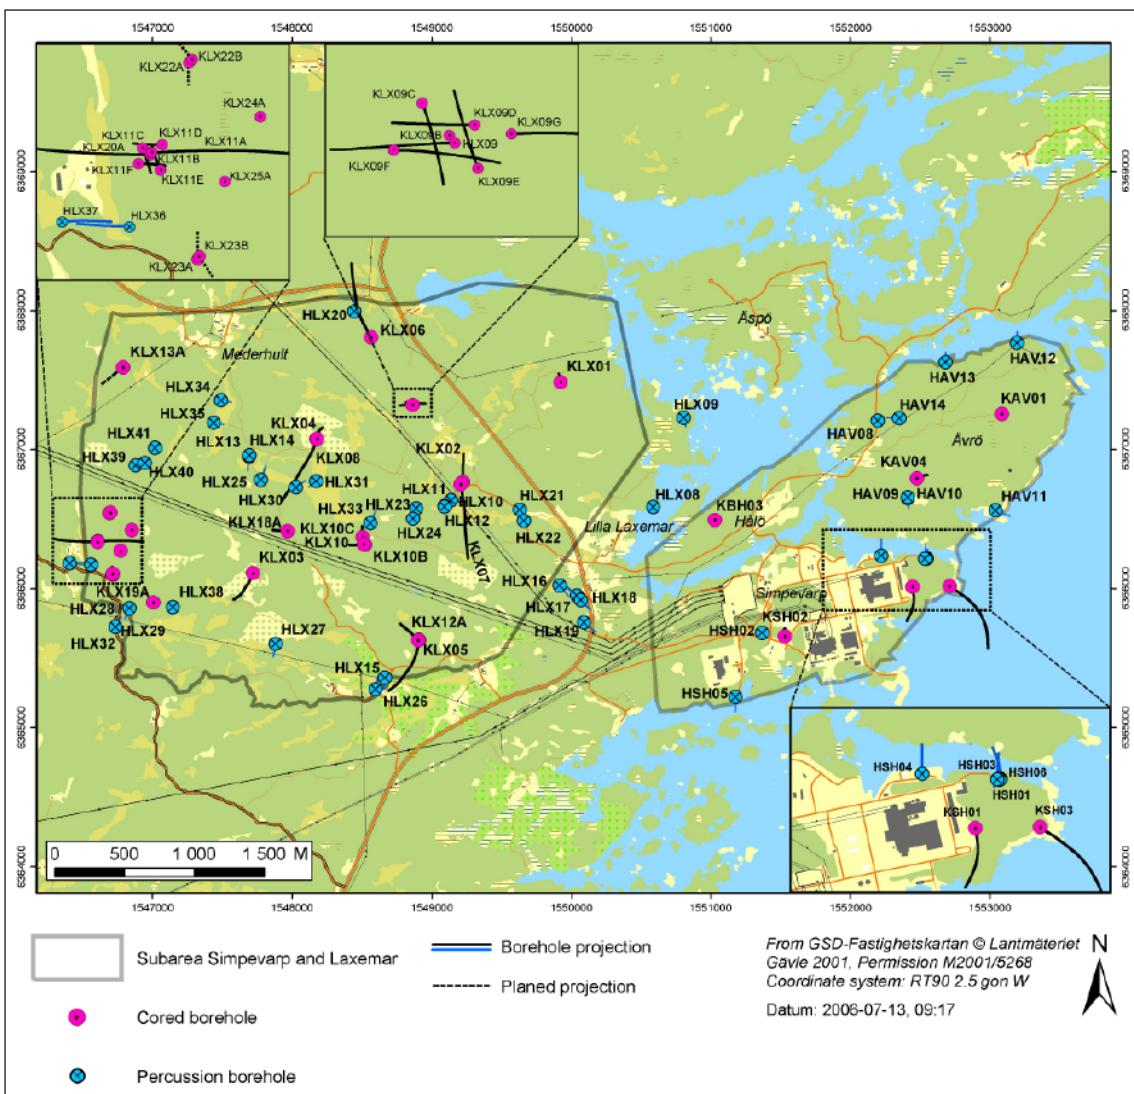

Figure 1-1. Overview of the Oskarshamn site investigation area, including the boreholes.

2 Objective and scope

This report summarises results from the water samples collected within the first sampling occasion of the Hydrochemical monitoring programme for core drilled boreholes 2006. According to the general programme for the site investigation area, the core drilled boreholes are monitored. The water sampling is performed in circulation sections that are sealed off using permanently installed packers. The monitoring programme will last at least until the decision about a future repository is made.

3 Equipment

3.1 Description of equipment

The water sampling is performed in borehole sections with permanently installed packers. The pump equipment used for the water sampling is schematically presented in Figure 3-1.

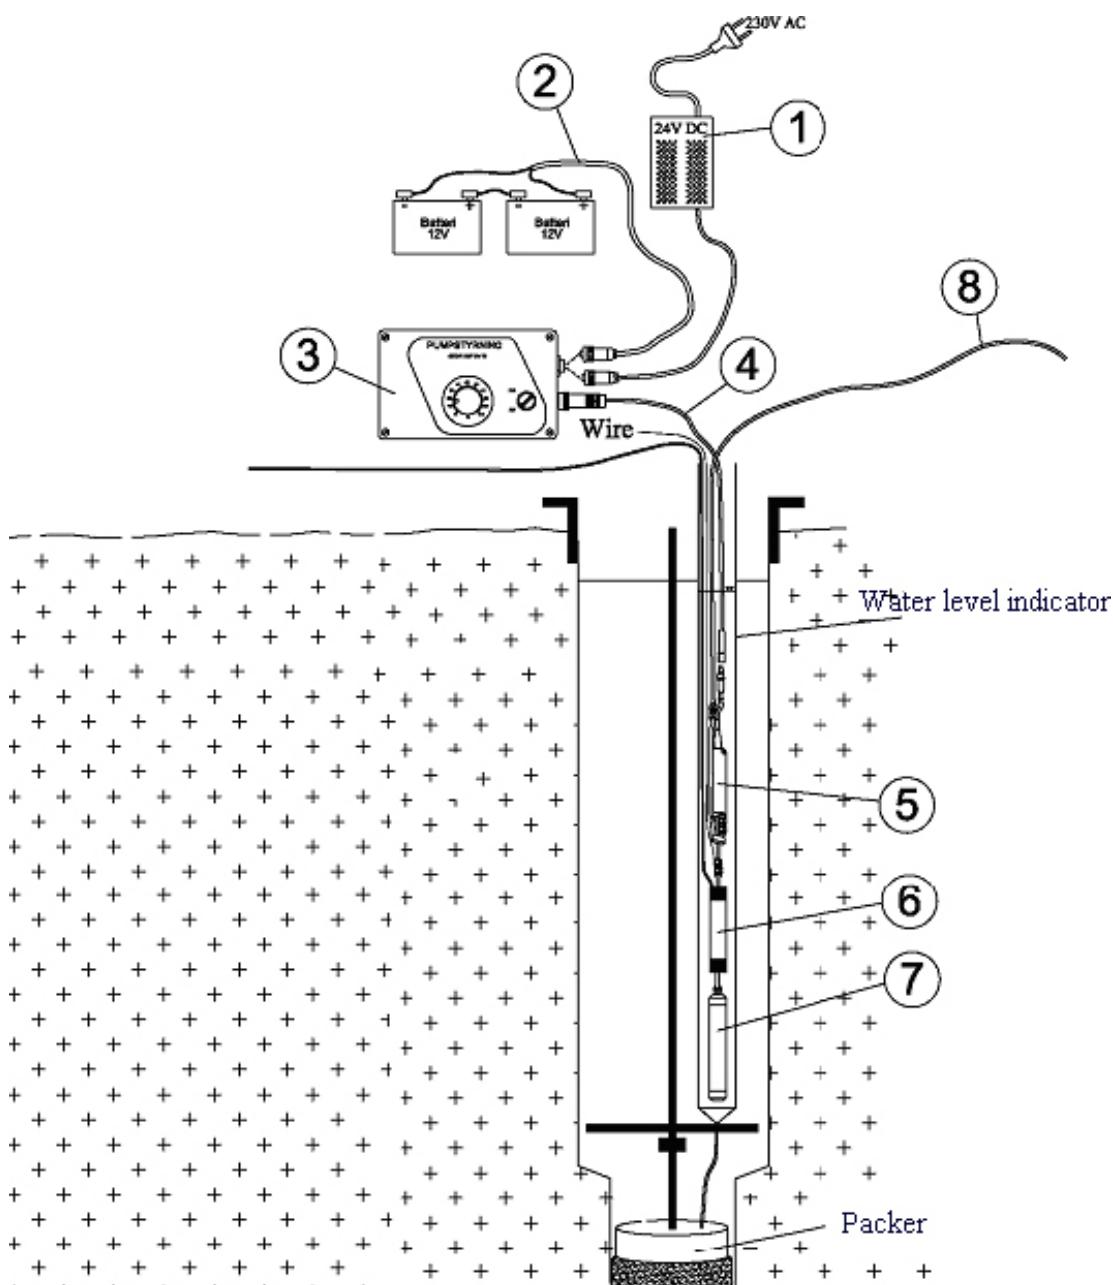

Figure 3-1. Schematic drawing of the equipment used for water sampling; 1. Battery eliminator
2. Battery cable 3. Pump control GEOPUMP UV 45 4. Pump Cable 5. GEOPUMP UV 45
6. Mini packer 7. Filter holder with filter 8. Pump tube, polyamide 8/6 mm.

4 Execution

4.1 General

The water sampling was performed using identical equipment set-ups, one in each borehole section, a schematic drawing is shown in Figure 3-1. The water volume in the pipe plus the volume in the section should preferably be converted five times, but at least three times before the water sample is taken (Table 4-1). The pumping volume is controlled by the down-hole pump. The drawdown is not allowed to exceed 20 m.

The water pumped up from the boreholes is collected in a tank and emptied onto the rinse plate at Simpevarp.

The activity was performed in accordance with the activity plan AP PS 400-06-060 and following the method description SKB MD 368.010 (System för hydrologisk och metrologisk datainsamling. Vattenprovtagning och utspädningsmätning i observationshål, SKB internal controlling document).

4.2 Preparations

The function of each pump was checked using a bucket. The tubes were cleaned or exchanged before installation in the borehole.

4.3 Execution of field work

The water sampling was performed in eleven sections listed in Table 4-1. The samples were collected after conversion of water at least three times in each section. For a detailed description see method description SKB MD 368.010 (System för hydrologisk och metrologisk datainsamling. Vattenprovtagning och utspädningsmätning i observationshål, SKB internal controlling document).

The water level in the borehole sections was logged in order to determine the maximal drawdown during the sampling period.

Table 4-1. Volume in tube and section and calculated pumping time.

Borehole	Borehole length (m)	Volume (tube + section) (L)	Volume x 3 (L)	Volume x 5 (L)	Calculated* pumping time (3 times the volume)	Calculated* pumping time (5 times the volume)
KAV01:3	391–434	38.27	114.81	191.35	3 h 50 min	6 h 23 min
KLX01:3	171–190	20.22	60.66	101.10	2 h 2 min	3 h 23 min
KLX02:2	1,145–1,164	75.30	225.90	376.50	7 h 32 min	12 h 33 min

KSH02:1	955–963	60.74	182.22	303.70	6 h 5 min	10 h 8 min
KSH02:4	411–439	36.28	108.84	181.40	3 h 38 min	6 h 3 min

* When the water flow is 500 mL/min.

4.4 Handling of water analysis data

The following routines for quality control and data management are generally applied for hydrogeochemical analytical data, independently of sampling method or sampling object.

Some of the constituents are determined by more than one method and/or laboratory. All analytical results are stored in the SICADA database. The applied hierarchy path “Hydrochemistry/Hydrochemical investigation/Analyses/Water in the database” contains two types of tables, raw data tables and primary data tables (final data tables).

Data on **basic water analyses** are inserted into the raw data tables for further evaluation. The evaluation results in a final reduced data set for each sample. These data sets are compiled in a primary data table named “water composition”. The evaluation is based on:

- Comparison of the results from different laboratories and/or methods.
- Calculation of charge balance errors, equation (1). Relative errors within $\pm 5\%$ are considered acceptable.

$$\text{Relative error}(\%) = 100 \times \frac{\sum \text{cations(equivalents)} - \sum \text{anions(equivalents)}}{\sum \text{cations(equivalents)} + \sum \text{anions(equivalents)}} \quad (1)$$

- General judgement of plausibility based on earlier results and experience.

All results from **special analyses of trace metals and isotopes** are inserted directly into primary data tables. In cases where the analyses are repeated or performed by more than one laboratory, a “best choice” notation will indicate those results which are considered most reliable.

An overview of the data management is given in Figure 4-1.

4.5 Water sampling, sample treatment and analyses

The pumped water from the borehole section is conveyed from the pipe into the sample bottles. Filtration and conservation of the samples was performed on-line at the site. A water sample is defined as groundwater collected on one occasion and consists of several sample portions, labelled with the same sample number.

An overview of sample treatment and analysis methods is given in Appendix 1. The routines are applicable independently of sampling method or type of sampling object. Three samples (11145, 11186 and 11210) were sent for control analysis of main components and eight samples (11145, 11146, 11176, 11185, 11186, 11208, 11209 and 11210) were sent for control analysis of bromide to two other laboratories. The analytical results are not reported here, but are present in the database SICADA.

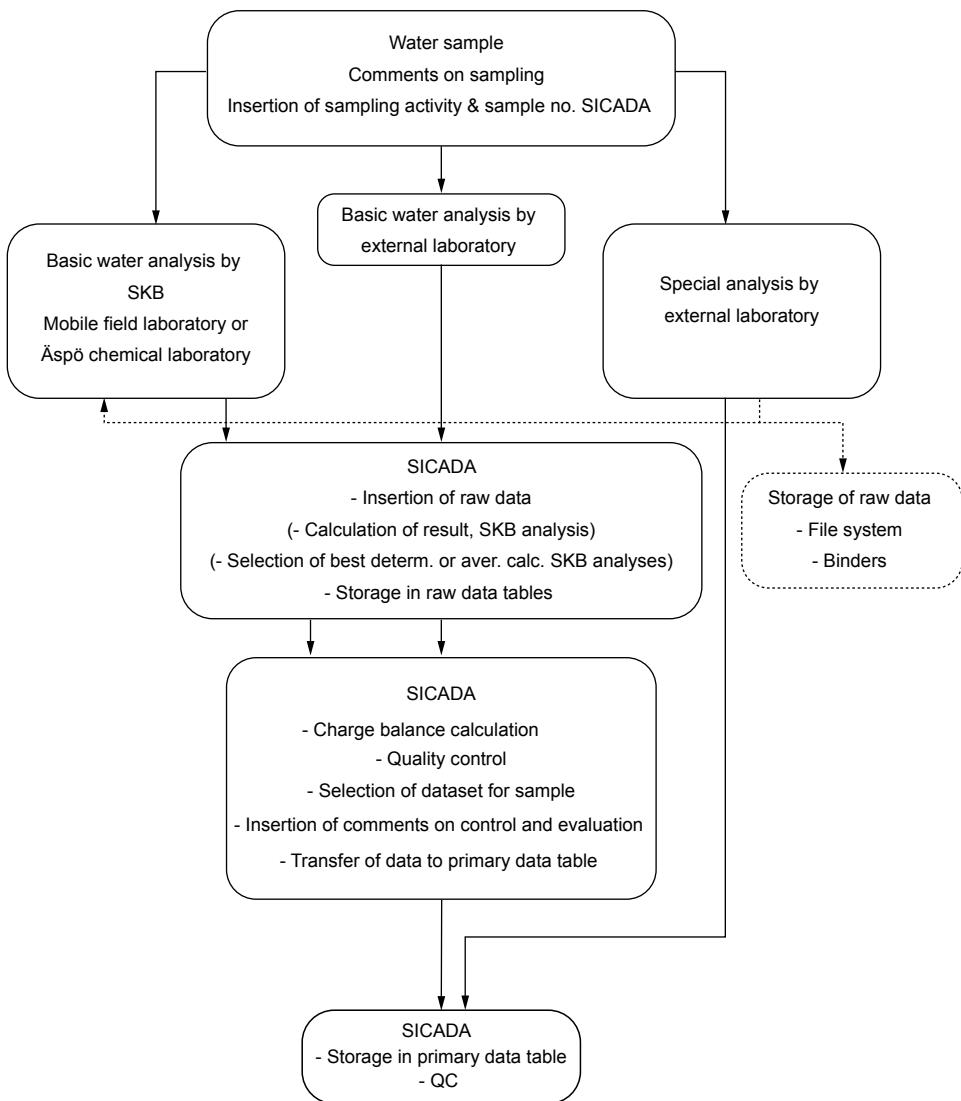

Figure 4-1. Overview of data management for hydrogeochemical data.

5 Results

The results obtained within this activity are water chemistry data from borehole sections KAV01:3, KLX01:3, KLX02:2, KLX02:5, KLX06:3, KLX06:6, KLX07A:2, KSH01A:4, KSH01A:7, KSH02:1 and KSH02:4. The results from the chemical analyses are presented below and in Appendix 2. The results are stored in the SICADA data base and are traceable by the activity plan number and sample number. It is the data in the data base that will be used for further interpretation (modelling).

(Some of the results from the second sampling occasion 2006 are presented in Appendix 2. A complete report is planned during 2007.)

5.1 Basic water analyses

The basic water analyses include Na, K, Ca, Mg, Si, Li, S, Sr, SO_4^{2-} , Cl^- , HCO_3^- , Br^- and F^- . Furthermore, measurements are made of pH, electrical conductivity, drill water content and density. The basic water analysis data and relative charge balance errors are compiled in Appendix 2, Table A2-1. The charge balance error gives an indication of the quality and uncertainty of the analyses of major constituents. The charge balance error exceeds the acceptable level of $\pm 5\%$ in one case, for KLX02:5. The error was most likely due to an unstable HCO_3^- value.

The drill water content in the samples collected during the pumping/measurement periods in the borehole sections are compiled in Appendix 2, Table A2-1.

Values of pH from laboratory and field analyses are compared in Figure 5-1.

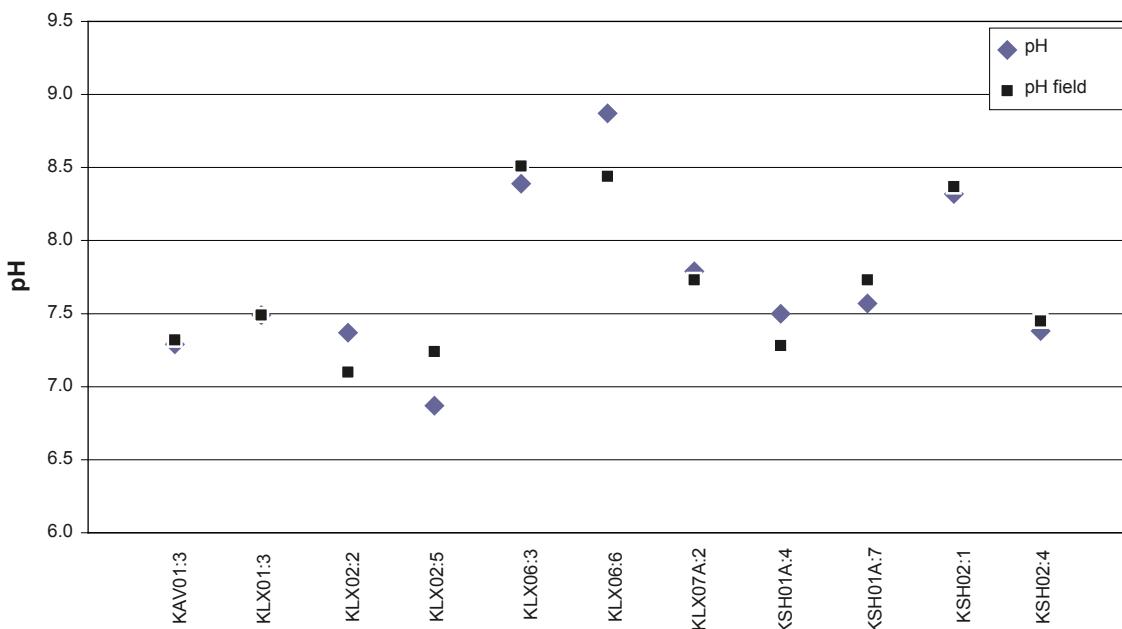

Figure 5-1. pH from laboratory and field analyses.

Sulphate (SO_4^{2-}) analysed using ion chromatography (IC) is compared with sulphate determined as total sulphur using inductively coupled plasma atomic emission spectrometry (ICP-AES) in Figure 5-2. In most samples, the sulphur content exists as sulphate species, but in i.e. KLX02:2 the hydrogen sulphide concentration was very high, resulting in a large discrepancy between the data points in Figure 5-2.

The chloride concentrations are plotted versus the corresponding electric conductivity values in Figure 5-3. The plot gives an approximate indication that the values are reasonable. The data from the borehole sections agree well with earlier data from the Äspö Hard Rock Laboratory.

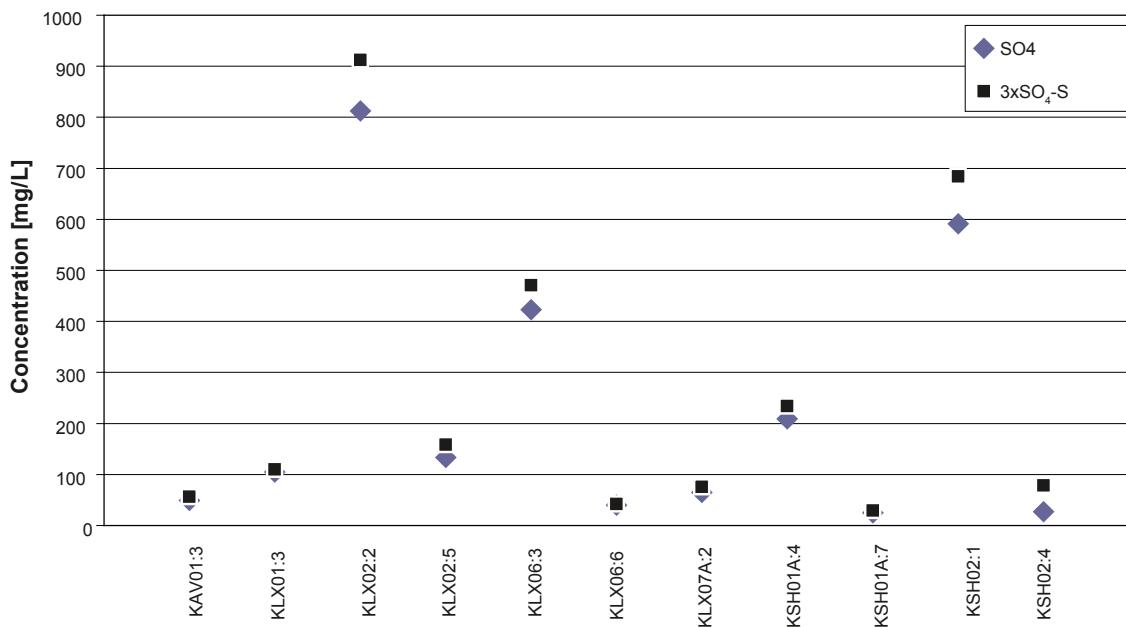

Figure 5-2. Sulphate (SO_4 by IC) data compared to sulphate calculated from total sulphur ($3\text{xSO}_4\text{-S}$ by ICP) data from samples collected in the investigated sections.

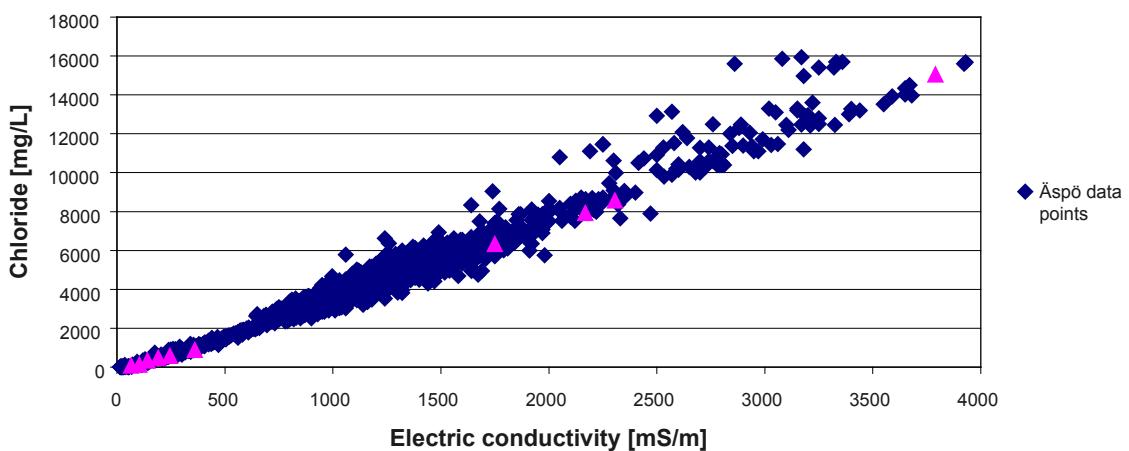

Figure 5-3. Chloride concentration versus electrical conductivity. Data points from this investigation are shown as pink triangles. Data from earlier investigations at the Äspö Hard Rock Laboratory are used to show the overall trend (blue rhombs).

5.2 Trace elements (rare earth metals and others)

The analyses of trace and rare earth metals include U, Th, As, Sc, Cd, Hg, V, Rb, Y, Zr, In, Cs, Ba, La, Hf, Tl, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb and Lu. Commonly occurring metals, such as Cu, Zn, Pb and Mo are not included in the analysis programme due to contamination considerations. The trace element data are compiled in Appendix 2, Table A2-2.

5.3 Stable and radioactive isotopes

The isotope determinations include the stable isotopes $\delta^2\text{H}$, $\delta^{18}\text{O}$, $\delta^{34}\text{S}$, $\delta^{37}\text{Cl}$, $^{87}\text{Sr}/^{86}\text{Sr}$, $^{10}\text{B}/^{11}\text{B}^*$, ^{14}C , $\delta^{13}\text{C}$ as well as the radioactive isotope ^3H (TU), ^{226}Ra , ^{222}Rn , ^{238}U , ^{234}U and ^{230}Th . The isotope data are compiled in Appendix 2, Table A2-3. The ^3H and $\delta^{18}\text{O}$ results from the investigated sections are presented in Figure 5-4. The ^3H content was below the detection limit (0.8 Tritium Units (TU)) in KLX06:3, KLX06:6, KSH01A:4, KSH01A:7 and KSH02:4.

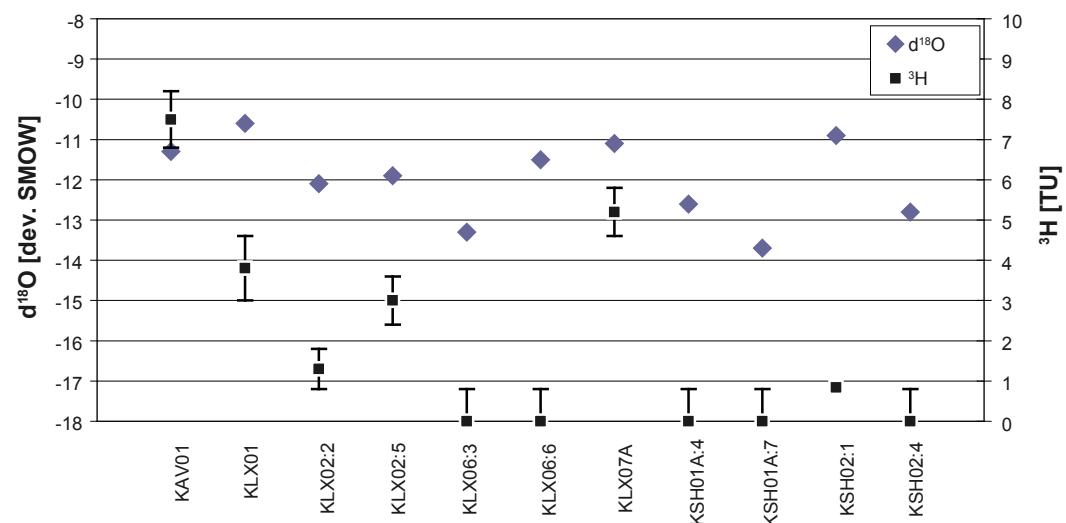

Figure 5-4. $\delta^{18}\text{O}$ and ^3H data from samples collected in the investigated sections.

*The B-isotope ratio is given as $^{10}\text{B}/^{11}\text{B}$ (the result reported from the consulting laboratory). If one wants to use the notation according to international standard for environmental isotopes, $^{11}\text{B}/^{10}\text{B}$, it is necessary to invert the $^{10}\text{B}/^{11}\text{B}$ value ($1/^{10}\text{B}/^{11}\text{B}$).

6 Summary

- Comparison of the results from different laboratories and/or methods showed agreement in most cases.
- The charge balance error exceeded the acceptable level of $\pm 5\%$ in one case, for KLX02:5.
- General judgement of plausibility based on earlier results and experience indicated reasonable values, in most cases.

1. Reporting limits at salinity ≤ 0.4% (520 mS/m) and ≤ 3.5% (3,810 mS/m) respectively.
2. Measurement uncertainty reported by consulted laboratory, generally 95% confidence interval.
3. Estimated total uncertainty by experience (includes effects of sampling and sample handling).
4. Per mill deviation¹¹ from SMOW (Standard Mean Oceanic Water).
5. TU=Tritium Units, where one TU corresponds to a Tritium/hydrogen ratio of 10⁻¹⁸ (1 Bq/L Tritium = 8.45 TU).
6. Per mill deviation¹¹ from SMOC (Standard Mean Oceanic Chloride).
7. Per mill deviation¹¹ from PDB (the standard PeeDee Belemnite).
8. The following relation is valid between pmC (percent modern carbon) and Carbon-14 age:

$$\text{pmC} = 100 \times e^{((1,950 - y - 1.03t) / 8,274)}$$
where y = the year of the C-14 measurement and t = C-14 age
9. Per mill deviation¹² from CDT (the standard Canyon Diablo Troilite).
10. Isotope ratio without unit.
11. The following expressions are applicable to convert activity to concentration, for uranium-238 and thorium-232:

$$1 \text{ ppm U} = 12.4 \text{ Bq/kg}^{238}\text{U}$$

$$1 \text{ ppm Th} = 3.93 \text{ Bq/kg}^{232}\text{Th}$$
12. Isotopes are often reported as per mill deviation from a standard. The deviation is calculated as:

$$\delta\text{l} = 1,000 \times (\text{K}_{\text{sample}} - \text{K}_{\text{standard}}) / \text{K}_{\text{standard}}$$
, where K = the isotope ratio and l = ²H, ¹⁸O, ³⁷Cl, ¹³C or ³⁴S etc.

Appendix 2

Groundwater chemistry data

Compilation december 2006, results below the line refer to winter sampling
