This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the author and do not necessarily coincide with those of the client.

Data in SKB's database can be changed for different reasons. Minor changes in SKB's database will not necessarily result in a revised report. Data revisions may also be presented as supplements, available at www.skb.se.

A pdf version of this document can be downloaded from www.skb.se.

Abstract

Hydrochemical logging, also called tube sampling, has been performed in the core drilled borehole KLX19A. The method is a fast and simple sampling technique for obtaining information about the chemical composition of the water along an open borehole. The equipment consists of an approximately 1,000 m long polyamide tube divided into units of 50 m. An appropriate number of tube units can be used to suit the actual borehole length, in this case c. 800 m.

The water content in each tube unit constituted one sample. Every second sample, starting with the lowest tube unit, was analysed according to SKB chemistry class 3 (isotope options excluded) at the sampling occasion. The performance and results from this sampling has been reported in a previous report /1/. This report gives the results from the performed isotope determinations of tritium (^3H), deuterium ($\delta^2\text{H}$) and oxygen-18 ($\delta^{18}\text{O}$). Only four of the samples intended for isotope determination were analysed due to high drill water content in the other samples /1/. The samples were collected at the time of sampling and stored in a freezer (^3H in a refrigerator) for approximately six months before they were sent to the consulting laboratories for analysis.

Sammanfattning

Hydrokemisk loggning, också kallad slangprovtagning, har utförts i det kärnborrade borrhålet KLX19A. Metoden är snabb och enkel att använda för att erhålla information om den kemiska sammansättningen hos grundvattnet längs ett öppet borrhål. Utrustningen består av en cirka 1 000 m lång polyamidslang uppdelad i enheter om vardera 50 m. Lämpligt antal slangenheter kan användas för att anpassa längden till det aktuella borrhålets längd, i detta fall ca 800 m.

Innehållet i en slangenheter utgör ett prov. Varannan slangenheter, med start från den nedersta, analyserades enligt SKB kemiklass 3 (exklusive alla tillval) i direkt anslutning till provtagningstillfället. Utförande och resultat från denna provtagning har rapporterats i en tidigare primär-datarapport /1/. Denna rapport redovisar resultaten från utförda isotopanalyser av tritium (^3H), deuterium ($\delta^2\text{H}$) och syre-18 ($\delta^{18}\text{O}$). Bara fyra av proverna avsedda för isotopanalyser, skickades in för analys på grund av att halten kvarvarande spolvatten efter borrning var för hög i resten av proverna /1/. Proverna togs ut i samband med provtagningen och sparades i frys (^3H i kylskåp) i cirka sex månader innan de sändes iväg för analys till de konsulterade laboratorerna.

1 Introduction

This document reports the results of isotope analyses gained by the Hydrochemical logging, which is one of the activities performed within the site investigation at Oskarshamn /2, 3/. The work was carried out in accordance with Activity Plan AP PS 400-06-122. In Table 1-1 controlling documents for performing this activity are listed. Both the Activity Plan and the Method Descriptions are SKB's internal controlling documents.

This report is a complement to the previous report regarding the Hydrochemical logging in KLX19A /1/, which documented the performance and results from analyses of major constituents, anions, drill water content, electric conductivity, alkalinity, and pH. The original results are stored in the primary data base SICADA where they are traceable by the Activity Plan number.

Table 1-1. Controlling documents for the performance of the activity.

2 Objective and scope

Hydrochemical logging was performed in order to obtain an overview of the chemical composition of the water along the open core drilled borehole KLX19A. The technique used for sampling is fast and simple, also for boreholes of considerable lengths.

The analysis program has previously been carried out according to SKB chemistry class 3 except for optional isotopes and was published in a previous report /1/. The conducted isotope determinations include ^3H , $\delta^2\text{H}$ and $\delta^{18}\text{O}$.

3 Execution

3.1 Hydrochemical logging

The Hydrochemical logging in KLX19A was performed on October 18, 2006 according to the activity plan and in compliance with the method description (cf. Table 1-1).

The execution of field work and the equipment used have been described in a previous report regarding the Hydrochemical logging in KLX19A /1/.

Table 3-1. Overview of samples collected at the Hydrochemical logging in KLX19A. Filled cells represent collected samples. Striped (blue) fillings represent samples reported in a previous report /1/, light (yellow) fillings represent samples that have been analyzed. Dashed yellow fillings represent samples collected and stored in a freezer (³H in a refrigerator) and dashed (purple) cells represent archive samples.

✱ Only one archive sample due to lack of water in tube unit.

* The B-isotope ratio is given as ¹⁰B/¹¹B (the result reported from the consulting laboratory). The notation according to international standard for environmental isotopes is ¹¹B/¹⁰B, i.e. 1/(¹⁰B/¹¹B).

3.2 Sample treatment and chemical analysis

An overview of sample treatment and analysis routines of the activity is given in Appendix 1.

An overview showing the samples obtained at the logging occasion is given in Table 3-1. The sample portions for isotope analyses were stored in a freezer at SKB (^3H in a refrigerator) at the time of the Hydrochemical logging. Samples collected for determination of ^3H , $\delta^2\text{H}$ and $\delta^{18}\text{O}$ were sent for analysis to the consulting laboratories approximately six months after the sampling occasion i.e. in April 2007. The data from the Hydrochemical logging are stored in the database SICADA. The SKB sample numbers are 11389–11404. Since the drill water content was high, above 20%, in some of the samples, only samples with number 11390, 11392, 11394 and 11396 were sent for isotope determination.

3.3 Data handling

The following routines for quality control and data management are generally applied for hydrogeochemical analysis data, irrespectively of sampling method or sampling object.

All analytical results were stored in the SICADA database. The applied hierarchy path “Hydrochemistry/Hydrochemical investigation/Analyses/Water in the database” contains two types of Tables, raw data Tables and primary data Tables (final data Tables).

Data from basic water analyses are inserted into raw data Tables for further evaluation. The evaluation results in a final data set for each sample. These data sets are compiled in a primary data Table named “water_composition”. The evaluation is based on:

- Comparison of the results from different laboratories and/or methods. The analyses are repeated if a large disparity is noted (generally more than 10%).
- Calculation of charge balance errors. Relative errors within $\pm 5\%$ are considered acceptable (in surface waters $\pm 10\%$).

$$\text{Relative error (\%)} = 100 \times \frac{\sum \text{cations(equivalents)} - \sum \text{anions(equivalents)}}{\sum \text{cations(equivalents)} + \sum \text{anions(equivalents)}}$$

- General judgement of plausibility based on earlier results and experiences.

All results from special analyses of trace metals and isotopes are inserted directly into primary data Tables. In cases where the analyses are repeated or performed by more than one laboratory, a “best choice” notation will indicate the results considered most reliable.

An overview of the data management is given in Figure 3-1.

3.4 Nonconformities

The activity was performed without any deviations from the controlling documents for the activity that can affect the quality of data.

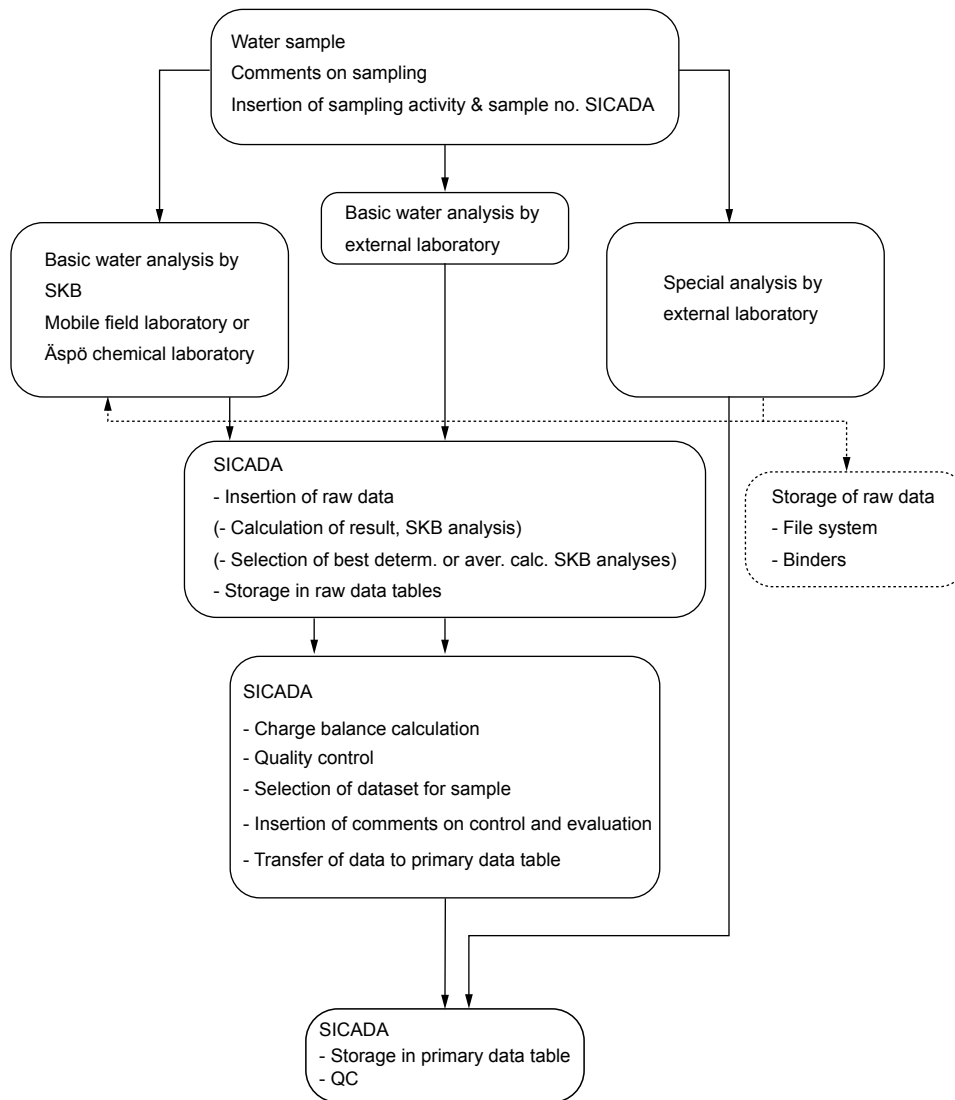

Figure 3-1. Overview of data management for hydrogeochemical data. This report only handles “Special analysis by external laboratory”. (The basic water analyses are reported in a previous report /1/.)

4 Results

Original data from the reported activity are stored in the primary database Sicada. Data are traceable in Sicada by the Activity Plan number (AP PS 400-06-122). Only data in databases are accepted for further interpretation and modelling. The data presented in this report are regarded as copies of the original data. Data in the databases may be revised, if needed. However, such revision of the database will not necessarily result in a revision of this report, although the normal procedure is that major data revisions entail a revision of P-reports. Minor data revisions are normally presented as supplements, available at www.skb.se.

Results from the hydrogen and oxygen isotope determinations received from the Hydrochemical logging are shown in Table 4-1. A diagram showing the ^3H and $\delta^{18}\text{O}$ values along the borehole, at the time of the Hydrochemical logging, is presented in Figure 4-1. The results are plotted for the mid-length of each tube unit.

Table 4-1. Hydrogen and oxygen isotope results for samples collected at the Hydrochemical logging in KLX19A.

Length (m)	Sample SKB:no	$\delta^2\text{H}$ (dev. SMOW)	^3H (TU)	$\delta^{18}\text{O}$ (dev. SMOW)
40–90	11390	–91.5	2.7	–11.3
140–190	11392	–92.9	2.7	–11.3
240–290	11394	–97.7	2.2	–11.3
340–390	11396	–95.3	2.6	–11.3

1. Reporting limits at salinity ≤ 0.4% (520 mS/m) and ≤ 3.5% (3,810 mS/m) respectively.
2. Measurement uncertainty reported by consulted laboratory, generally 95% confidence interval.
3. Estimated total uncertainty by experience (includes effects of sampling and sample handling).
4. Per mille deviation¹³ from SMOW (Standard Mean Oceanic Water).
5. TU=Tritium Units, where one TU corresponds to a Tritium/hydrogen ratio of 10⁻¹⁸ (1 Bq/L Tritium = 8.45 TU).
6. Per mille deviation¹³ from SMOC (Standard Mean Oceanic Chloride).
7. Per mille deviation¹³ from PDB (the standard PeeDee Belemnite).
8. The following relation is valid between pmC (percent modern carbon) and Carbon-14 age:

$$\text{pmC} = 100 \times e^{((1950-y-1.031)/8274)}$$
 where y = the year of the C-14 measurement and t = C-14 age.
9. Per mille deviation¹³ from CDT (the standard Canyon Diablo Troilite).
10. Isotope ratio without unit.

Isotopes are often reported as per mill deviation from a standard. The deviation is calculated as:

$$\delta\text{‰} = 1,000 \times (K_{\text{sample}} - K_{\text{standard}}) / K_{\text{standard}}$$
 where K= the isotope ratio and ‰ =²H, ¹⁸O, ³⁷Cl, ¹³C or ³⁴S etc.
