**Oskarshamn site investigation
Groundwater monitoring program
Report for January–August 2007**

Göran Nyberg, Eva Wass
Geosigma AB

October 2007

Keywords: Groundwater, Borehole, Instrumentation, Measurement methods, Monitoring, Oskarshamn.

This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the authors and do not necessarily coincide with those of the client.

Data in SKB's database can be changed for different reasons. Minor changes in SKB's database will not necessarily result in a revised report. Data revisions may also be presented as supplements, available at www.skb.se.

A pdf version of this document can be downloaded from www.skb.se.

Abstract

This document reports data obtained within the groundwater monitoring program, which is one of the activities performed within the site investigation at Oskarshamn. The objective of the groundwater monitoring is to support the hydrogeological characterization of the area and to document the groundwater conditions before a possible excavation.

Data presented in this report are collected during the period of January until August 2007 and consist of groundwater levels in boreholes. Meteorological and hydrological variables are also monitored within the framework of the site investigations but reported separately.

The data collecting system in HMS (Hydro Monitoring System) consists of two measurement stations (computers) which communicate with and collect data from a number of dataloggers. The computers are connected to the SKB Ethernet LAN. All data are collected by means of different transducers connected to different types of data loggers: Minitroll, LevelTroll, Mitec and Datataker.

In order to calibrate registrations from the data loggers, manual levelling of all sections is made, normally once every month. The logger data are converted to water levels using calibration constants. All collected data are subjected to a quality check, during which obviously erroneous data are removed and calibration constants are corrected so that the monitored data are consistent with the manual levelling. The status of the equipment is also controlled and service might be initiated.

Diagrams of groundwater levels for the period of January–August 2007 (daily values for each section) are presented in Appendix 1. The original results are stored in the primary data base Sicada. The data in this data base may then be used for further analysis.

There are no nonconformities with respect to the activity plan or the method description.

Sammanfattning

Denna rapport redovisar data erhållna inom grundvattenmoniteringsprogrammet, vilket är en av aktiviteterna inom platsundersökningen i Oskarshamn. Syftet med grundvattenmoniteringen är att stödja den hydrogeologiska karakteriseringen av platsen och att dokumentera grundvattenförhållanden före en eventuell byggnation.

Data presenterade i rapporten är insamlade under perioden januari till och med augusti 2007 och består av grundvattennivå i borrhål. Inom ramen för platsundersökningarna moniteras även meteorologiska och ythydrologiska variabler, men dessa presenteras i en annan rapport.

Datainsamlingssystemet i HMS (Hydro Monitoring System) består av två mätstationer (datorer) vilka kommunicerar med och samlar in data från ett antal dataloggers. Datorn är förbunden med SKB:s nätverk. Alla data samlas in med hjälp av olika givare förbundna med olika typer av dataloggrar: Minitroll, LevelTroll, Mitec och Datataker.

För att kunna kalibrera registreringarna från dataloggrarna utförs, vanligtvis en gång i månaden, manuell nivåregistrering (lodning) i alla sektioner. Loggerdata omvandlas till vattennivåer genom användande av kalibreringskonstanter. Alla insamlade data kvalitetskontrolleras. Under detta arbete tas uppenbart felaktiga data bort och kalibreringskonstanterna korrigeras så att automatiskt registrerade data överensstämmer med manuella nivåregistreringar. Vid dessa tillfällen kontrolleras utrustningens status och service kan initieras.

Diagram över grundvattennivåerna för perioden januari till augusti 2007 (en datapunkt per sektion och 24 timmar redovisas) visas i Appendix 1. Ursprungsresultatet lagras i primärdatabasen Sicada. Data från denna databas kan användas för vidare analyser.

Aktiviteten har utförts i överensstämmelse med aktivitetsplanen och metodbeskrivningen.

1 Introduction

This document reports data collected within the groundwater monitoring program, which is one of the activities performed within the site investigation at Oskarshamn. The work was carried out in accordance with activity plans SKB AP PS 400-06-159. In Table 1-1, controlling documents for this activity are listed. The activity plans and the method descriptions are SKB's internal controlling documents. The site investigation internal report, Table 1-2, presents the results from the quality check performed once every three months, see Chapter 4.4.

Data presented in this report include groundwater levels collected during January–August 2007.

The HMS (Hydro Monitoring System) is used to collect and store all data.

2 Objective and scope

The objective of the groundwater monitoring program during the site investigation is to determine baseline conditions of the natural variations of the groundwater levels prior to the potential excavation for a nuclear waste repository and to support the hydrogeological site characterization.

Data collected within this activity are:

- groundwater level in boreholes,
- surface water level in streams.

There are also some parameters that are used for monitoring of the function of the measurement system itself. However, these are not reported herein.

The following numbers of boreholes and probing points were monitored during the reporting period within the Oskarshamn site investigation:

- 35 core-drilled boreholes,
- 43 percussion-drilled boreholes,
- 70 soil wells,
- 2 probing points monitoring surface water level in streams.

The locations of the boreholes and probing points monitored during the reporting period are shown in Figure 2-1. A list of the boreholes along with some basic information is compiled in Table 2-1 and in Table 5-1.

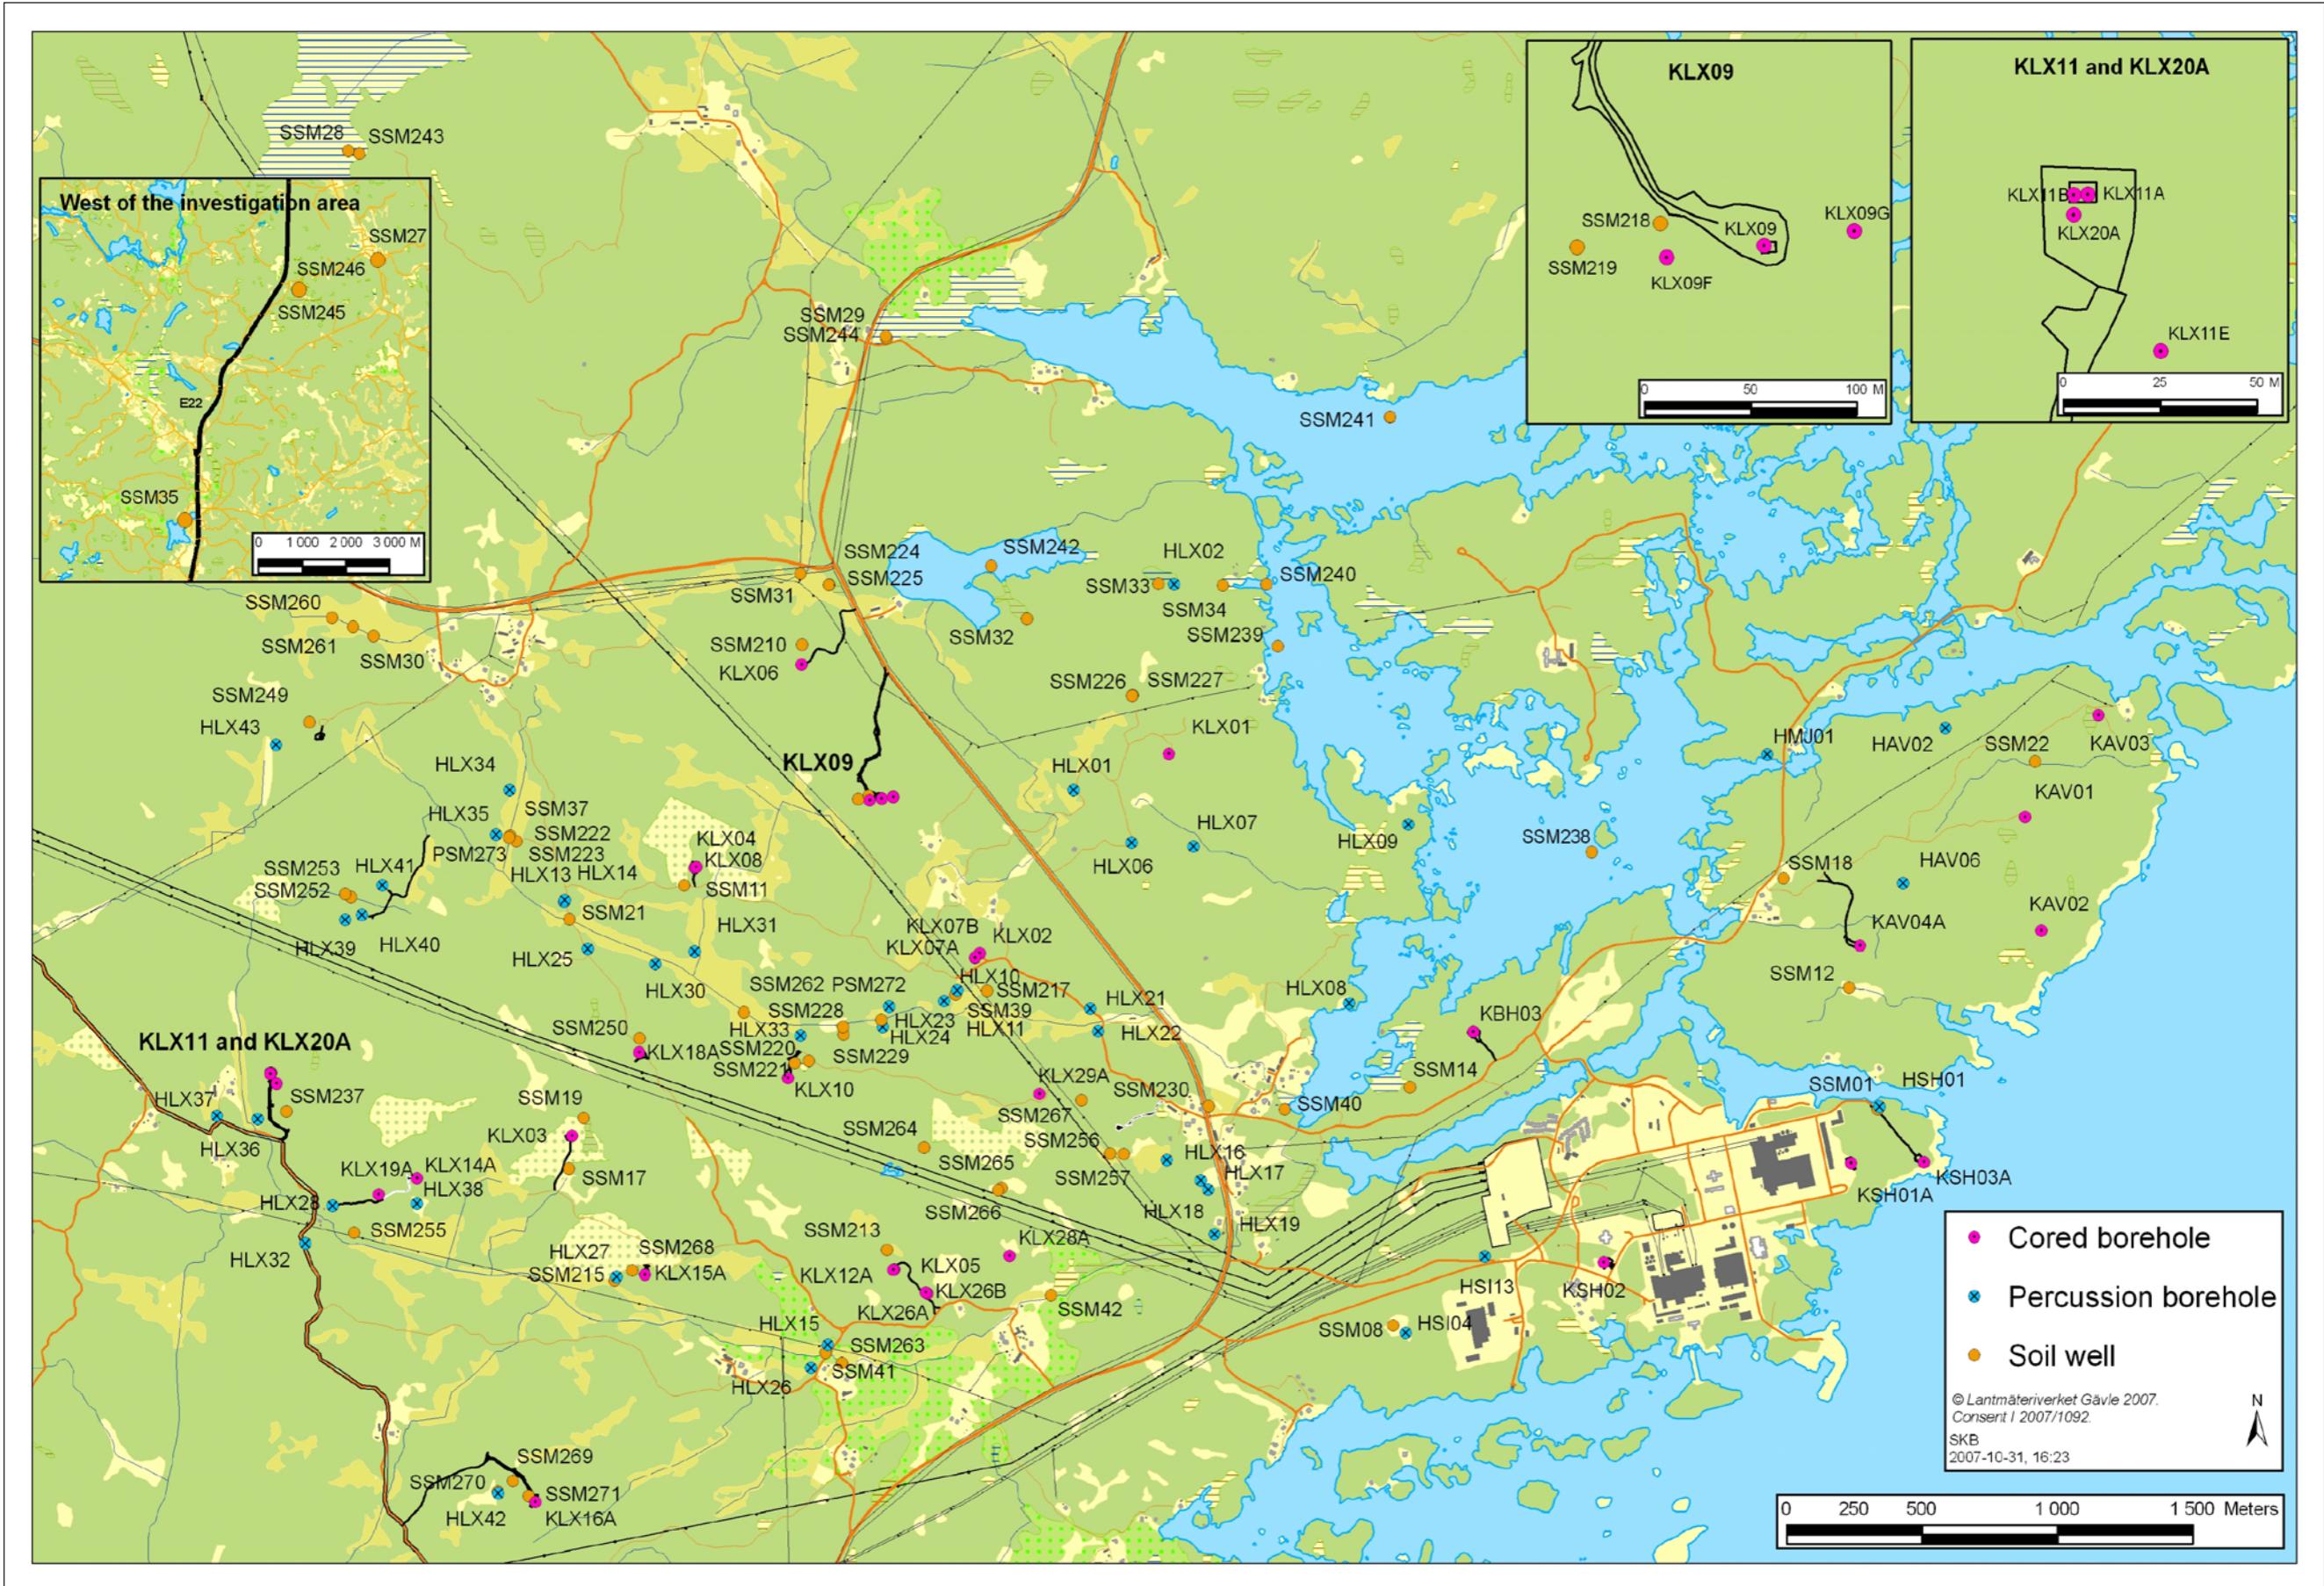

Figure 2-1. Overview of the Oskarshamn site investigation area showing the locations of monitored boreholes.

Table 2-1. Borehole length, inclination, elevation at top of casing (TOC) and date for the completion of drilling.

3 Equipment

3.1 Description

Drawings of the borehole equipment for permanent instrumentation in core boreholes and percussion boreholes are presented in Figure 3-1 and Figure 3-2, respectively. Figure 3-3 shows a more detailed close-up of the standpipe in which the pressure transducer is situated in these boreholes.

In Figure 3-4 the instrumentation in soil wells is shown. In open percussion and core boreholes, as in the soil wells, a transducer or data logger is submerged in the groundwater without any other equipment.

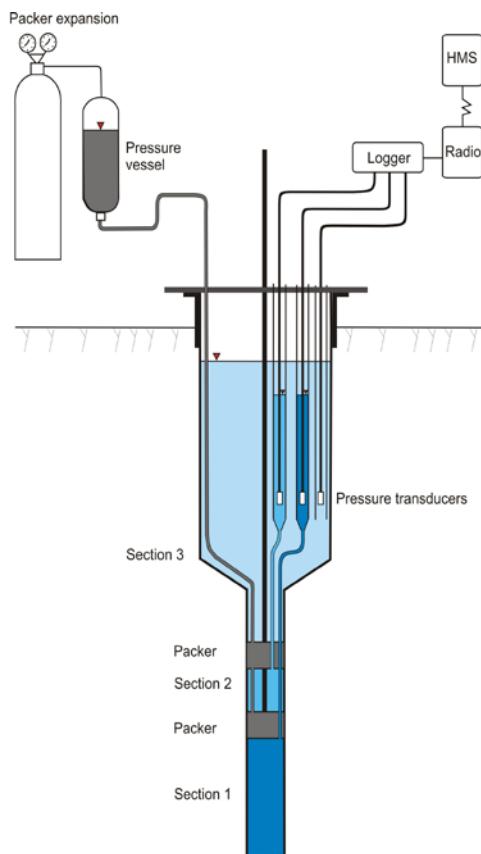

Figure 3-1. Explanatory sketch of permanent instrumentation in core boreholes.

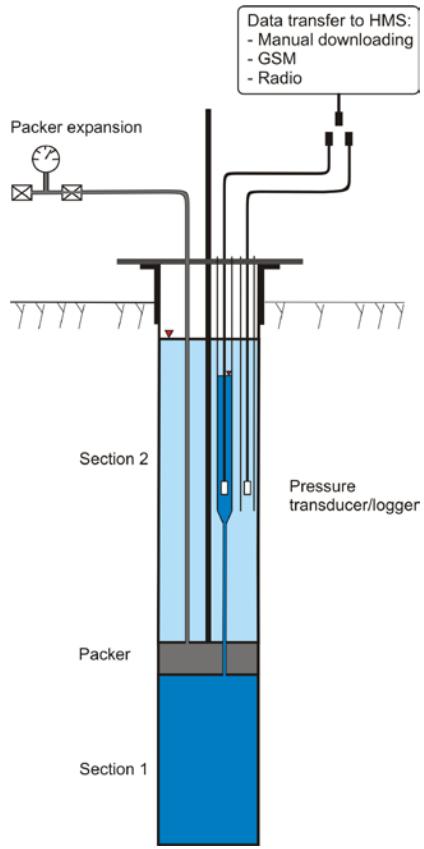

Figure 3-2. Explanatory sketch of instrumentation in percussion boreholes.

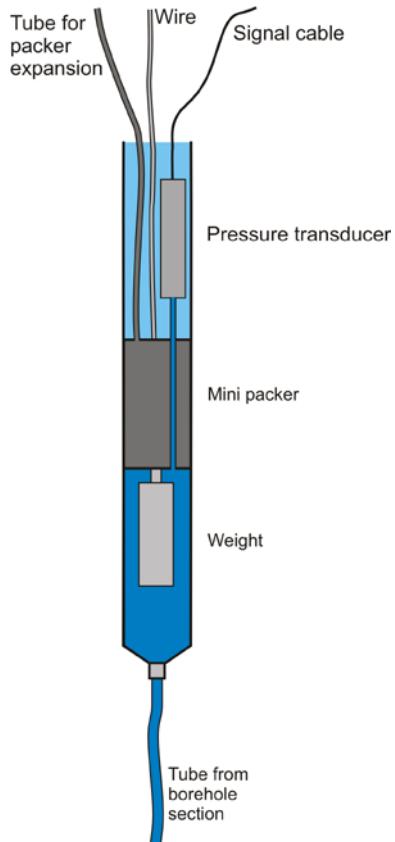

Figure 3-3. Explanatory sketch of instrumentation in standpipes in core and percussion boreholes.

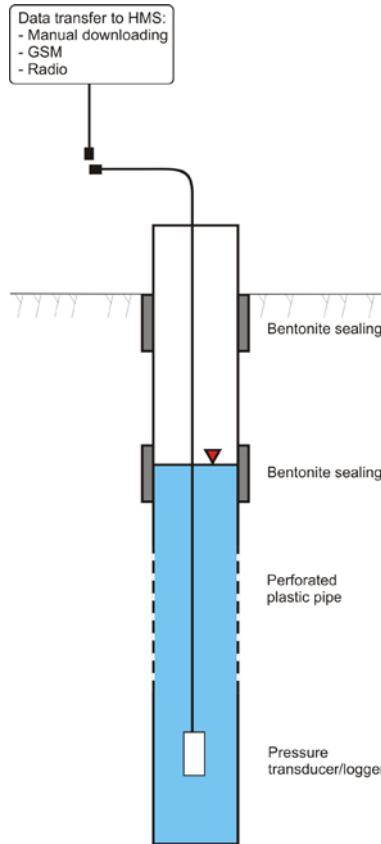

Figure 3-4. Explanatory sketch of instrumentation in soil wells.

3.2 Data collection

The data collecting system, which is part of the Hydro Monitoring System (HMS), consists of two measurement stations (computers). A measurement station collects data from a number of data sources, see Figure 3-5. The computers are connected to the SKB Ethernet LAN.

The on-line system is designed to be able to handle short interruptions in the communication. Data can be stored for at least a couple of hours in the loggers. All data are finally stored in the main measurement station. Tape backup is made of all data.

All data are collected by means of different types of pressure transducers connected to different types of data loggers or by manual levelling. Table 3-1 shows the monitoring equipment used in different boreholes and probing points. The following data loggers are used:

Minitroll: a single channel data logger of stand-alone type where the transducer is integrated in the logger. The logger is submerged in the groundwater and has the capacity to store 80,000 data.

Leveltroll: the successor to Minitroll, which is no longer manufactured. It is a logger that in most respects is equal to Minitroll, but has the capacity to store 350,000 data.

Mitec: a data logger connected on-line by means of GSM telephony. A pressure transducer of the type Druck PTX is connected to the logger. Only the transducer is submerged in the groundwater. The logger uses two or four channels. During monitoring in boreholes, one channel is used for monitoring of the battery voltage and the other ones can be used for pressure and temperature monitoring.

Datataker: a data logger connected on-line by means of radio or network. The logger has 42 channels and is used only for monitoring in percussion and core boreholes.

Monitored data that have been quality assured are transferred quarterly to the site characterization database, Sicada.

HMS – Data sources

Note - Data not relevant for the reported period January–August 2007 are to be found in earlier reports /1, 2/ or /3/.

4 Execution

4.1 General

Data are collected to the measurement system, HMS, as described in Chapter 3.

4.2 Field work

Manual levelling is generally performed once a month. At the same time, the equipment is checked and maintenance is performed.

All data from stand-alone type loggers are manually transferred to a portable PC or PDA and then transmitted to the measurement station.

4.3 Data handling

4.3.1 Calibration method

Manual levelling of all sections is normally made once every month, in order to calibrate the registrations from the data loggers.

The logger data is transformed to water levels by means of a linear calibration equation and also by subtracting the air pressure since all transducers give the absolute pressure. Converted logger data are then compared with results from manual levelling. If the two differs, calibration constants are adjusted until an acceptable agreement is obtained.

4.3.2 Recording interval

Measurements of the groundwater level are normally made with one-minute intervals for percussion and core boreholes and with five-minute intervals for soil wells.

Measured values are not stored unless they differ from the previously stored value by more than 0.1 m for percussion and core boreholes, and 0.05 m for soil wells. In addition to this, a value is always stored every two hours.

However, in most boreholes the recording intervals are shortened since they are located in areas of high interest.

4.4 Quality assurance

Preliminary inspection of all collected data is performed once every week. The purpose of this is to certify that all loggers are sending data and that all transducers are functioning.

All data collected are subject to a quality check once every quarter. During this Q/A, obviously erroneous data are removed and calibration constants are corrected so that the monitored data agree with the manual levelling data (see section 4.3.1). At this occasion, the status of the equipment is also checked and service might be initiated by notifying the client via e-mail.

4.5 Nonconformities

There are no nonconformities with respect to the activity plan or the method description.

5 Results

5.1 General

Original data from the reported activity are stored in the primary database Sicada. Data are traceable in Sicada by the Activity Plan number (AP PS 400-06-159). Only data in databases are accepted for further interpretation and modelling. The data presented in this report are regarded as copies of the original data. Data in the databases may be revised, if needed. However, such revision of the database will not necessarily result in a revision of this report, although the normal procedure is that major data revisions entail a revision of P-reports. Minor data revisions are normally presented as supplements, available at www.skb.se.

5.2 Groundwater levels

Diagrams of groundwater levels are presented in Appendix 1. All levels in the diagrams are given as meters above sea level in the national elevation system (RT90-RHB70).

In the diagrams, daily values are presented for each section. The data point shown is the first stored data point after midnight. When registrations are missing, manually levelled data, if available, are inserted.

A list of monitored borehole sections is presented in Table 5-1, where the lengths along the boreholes to top and bottom of each section are given. When packers have been installed in percussion or cored boreholes, the dates for installation/removal of the packers are given. In open boreholes (except the soil wells), the dates for installation/removal of pressure transducer/logger are given together with a comment. No information about periods between packer removal and re-installation or between measurement periods is given. For the soil wells, the dates refer to when drilling was completed.

Table 5-1. Monitored sections.

Water level in the stream Ekerumsån		
PSM000272	2007-02-07	Measurement start date
PSM000273	2007-06-08	Measurement start date

Note - Data not relevant for the reported period January–August 2007 are to be found in earlier reports /1, 2/ or /3/.

* For the soil wells (SSM-boreholes), the bottom of the section refers to the bottom of the plastic pipe installed in the borehole. The plastic pipe is screened.

** Borehole length is set to 0.0 at centre of top of casing. If there is only one section in the borehole and the given borehole length is from 0.0 m it implies that no packers are installed and that it is an open borehole.

5.2.1 General comments

Results from the measurements in surface boreholes are presented in diagrams. Level data from all sections in each borehole are presented in diagrams for the period of January until August 2007.

The symbols used in the diagrams are:

Sometimes it is difficult to differentiate registrations from individual sections in the diagrams. However, since the main purpose of this report is to present an overall view of the long-term changes, it was not found to be advantageous to show more detailed diagrams from individual sections. More detailed diagrams during test periods are presented in reports from the different tests.

Due to failures in the mechanical or electronic equipment, data is sometimes missing for longer or shorter periods. This is not commented on below. For more comments on the diagrams, see Site investigation Internal Reports.

Remarks are given when the registration for some reason has a deviating appearance. When registrations are missing, manually levelled data, if available, are inserted.

In many boreholes, the groundwater level shows large and rapid variations. This is often due to nearby drilling. Also, many borehole sections are influenced by other activities such as pumping, water sampling, tracer tests etc.

Packers may deflate due to leakage, which can be difficult to discover. If a section in a borehole suddenly shows a pressure that is close to the pressure in a neighbouring section, the reason might be deflated packers.

5.2.2 Comments on some of the diagrams

HLX02: The groundwater level in this borehole responds quickly to rain/snowmelt.

HLX16: The borehole is mostly artesian from the middle of November 2006.

HLX35: The borehole packer has been deflated from the end of January to the middle of February 2007.

HLX37: Section 3 is artesian from the end of November 2006.

KLX01: The higher level that occurs for shorter periods in section 4 is due to precipitation/snowmelt.

KLX12A: Due to a leaking tube there is a short circuit between sections 2 and 5 from the installation in November 2006 until the end of April 2007, when the equipment is lifted for repair.

KLX14A: Absolute levels have been calculated from transducer positions as no manual levellings have been performed during the measurement period.

KLX26A and KLX26B: Absolute levels have been calculated from transducer positions as no manual levellings have been performed during the measurement period.

KSH01A: The deviating appearance for section 1 is probably caused by the very low transmissivity in this section (or poor communication between the standpipe and the section). The mini-packer is released when manual levelling is performed and a sudden jump in the level occurs. Thereafter, when the mini-packer is inflated again, the level is slowly approaching the actual level in the borehole section.

SSM000217 and SSM000218: Most of the data from June and from the later part of August have been removed because the boreholes were reported to be dry during those periods.

SSM000270: By the look of the registration, the borehole seems to be dry during most of June 2007. However, during this period no manual levelling has been performed to confirm this and therefore no data have been removed.

SSM000271: From the middle to the end of June 2007, the registered pressure is equal to the air pressure, implying that the groundwater level is below the pressure transducer. Prior to this, a pressure below air pressure is measured for about a week. This behaviour could possibly occur if the transducer is measuring in drying clay at the bottom of the borehole.

Appendix 2

Hydraulic disturbances in boreholes – GANTT chart

The extensive geoscientific investigation programme that took place during the period for this monitoring report generated fluctuations in groundwater level to various degree.

This appendix compiles, in chronological order, the dates when major hydraulic disturbances took place in boreholes. A word of caution, the compilation endeavoured to be complete but does nevertheless not necessarily constitute all disturbances.

Hydraulic disturbances:

- **Core drilling:** While drilling of core boreholes includes a) flushing and air-lift pumping and b) nitrogen lifting.
- **Percussion drilling:** Is done with DTH-technology which involves constantly flushing out the boreholes water and drill chips with air while drilling. Separate airlifting operations are also included.
- **Pumping test submersible pump:** Conventional test for assessment of aquifer properties, including interference testing, flow logging (spinner and difference flow logging).
- **Pumping for drilling water supply:** While core drilling large amount of drilling fluid is required, water taken from a percussion hole serve this purpose.
- **Injection test:** Constant head injection test of relatively short duration, are done in sections along the complete borehole length for characterisation of aquifer properties. Injection phase duration is usually 20-30 min.
- **Pumping for water supply:** An site investigation borehole (HLX22) was taken into production as a water supply well to the village of Lilla Laxemar.
- **Water pumping:** Pumping for sampling of water for chemical analysis.
