This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the authors and do not necessarily coincide with those of the client.

Data in SKB's database can be changed for different reasons. Minor changes in SKB's database will not necessarily result in a revised report. Data revisions may also be presented as supplements, available at www.skb.se.

A pdf version of this document can be downloaded from www.skb.se.

Abstract

This report summarises the results from the hydrogeochemical monitoring programme for core and percussion drilled boreholes 2007. Groundwater sampling has been performed in permanently installed boreholes in summer during June–August, and in autumn during November–December. Throughout the summer period groundwater sampling was carried out in totally 11 sections; KLX02:2, KLX05:3, KLX05:7, KLX07A:2, KLX08:3, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3, KLX19A:3 and HLX20:2. The autumn sampling period included sampling of groundwater from 10 sections; KLX04:5, KLX05:7, KLX07A:2, KLX08:3, KLX08:4, KLX10A:2, KLX12A:2, KLX15A:3, KLX18A:3 and KLX19A:3.

The programme started in 2005 and since then water sampling has been performed twice every year. The objective of the hydrogeochemical monitoring programme is to determine the groundwater composition in selected sections chosen for this purpose. The sampling method during 2007 was gradually changed in comparison with previous years. Sampling was made in time series instead of after 3–5 conversions.

Obtained results from the activities presented here include groundwater chemistry data in accordance with SKB chemistry class 5 including options and SKB chemistry class 3 including options. Options for SKB chemistry class 5 include lanthanoids and other trace elements, As, In, environmental metals, TOC and the isotopes ^{34}S , ^{37}Cl , $^{87}\text{Sr}/^{86}\text{Sr}$, $^{10}\text{B}/^{11}\text{B}$, ^{13}C , ^{226}Ra , ^{222}Rn , ^{238}U , ^{234}U and ^{230}Th . Options for SKB chemistry class 3 include TOC, DOC and the isotopes ^2H , ^{18}O and ^3H .

All data from the activity are stored in the Sicada database.

Sammanfattning

Denna rapport sammanfattar resultaten från det hydrogeokemiska moniteringsprogrammet för kärn- och hammarborrhål år 2007. Grundvattenprovtagning har genomförts i permanent installerade borrhål under en sommaromgång, juni–augusti, samt en höstomgång, november–december. Under sommaromgången provtogs 11 sektioner; KLX02:2, KLX05:3, KLX05:7, KLX07A:2, KLX08:3, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3, KLX19A:3 och HLX20:2. Höstomgången omfattade provtagning i 10 sektioner; KLX04:5, KLX05:7, KLX07A:2, KLX08:3, KLX08:4, KLX10A:2, KLX12A:2, KLX15A:3, KLX18A:3 och KLX19A:3.

Moniteringsprogrammet startade 2005 och provtagning har genomförts två gånger per år. Syftet med provtagningen är att dokumentera grundvattensammansättningen för de i programmet ingående borrhålssektionerna. Under 2007 har provtagningsmetodiken successivt förändrats i jämförelse med tidigare år; istället för provtagning efter 3–5 omsättningar har provtagning utförts i tidsserier.

Resultat från denna aktivitet inkluderar vattenkemidata enligt SKB kemiklass 5 med tillval och SKB kemiklass 3 med tillval. Tillval till SKB kemiklass 5 utgörs av lantanoider och övriga spårelement, As, In, miljömetaller, TOC samt isotoperna ^{34}S , ^{37}Cl , ^{87}Sr , $^{10}\text{B}/^{11}\text{B}$, ^{13}C , ^{226}Ra , ^{222}Rn , ^{238}U , ^{234}U och ^{230}Th . Tillval till SKB kemiklass 3 utgörs av TOC, DOC och isotoperna ^2H , ^{18}O och ^3H .

All data från aktivitetens genomförande återfinns i databasen Sicada.

1 Introduction

This document presents the data collected during 2007 within the hydrogeochemical monitoring programme for core and percussion drilled boreholes.

The work was carried out in accordance with activity plan AP PS 400-07-044 including supplements. Documents controlling the performance of this activity are listed in Table 1-1. Both the activity plan and the method descriptions are SKB internal controlling documents.

The field work was carried out in June–August and in November–December 2007. During the summer period groundwater sampling was carried out in 11 borehole sections, while the autumn period included sampling of groundwater from 10 borehole sections.

Data from the filed work, as well as analytical results, are traceable by the number of the activity plan in the database Sicada.

A map showing the investigation site at Oskarshamn, including the boreholes sampled in the hydrogeochemical monitoring programme for core and percussion drilled boreholes 2007, is presented in Figure 1-1.

Table 1-1. Documents controlling the performance of the activity.

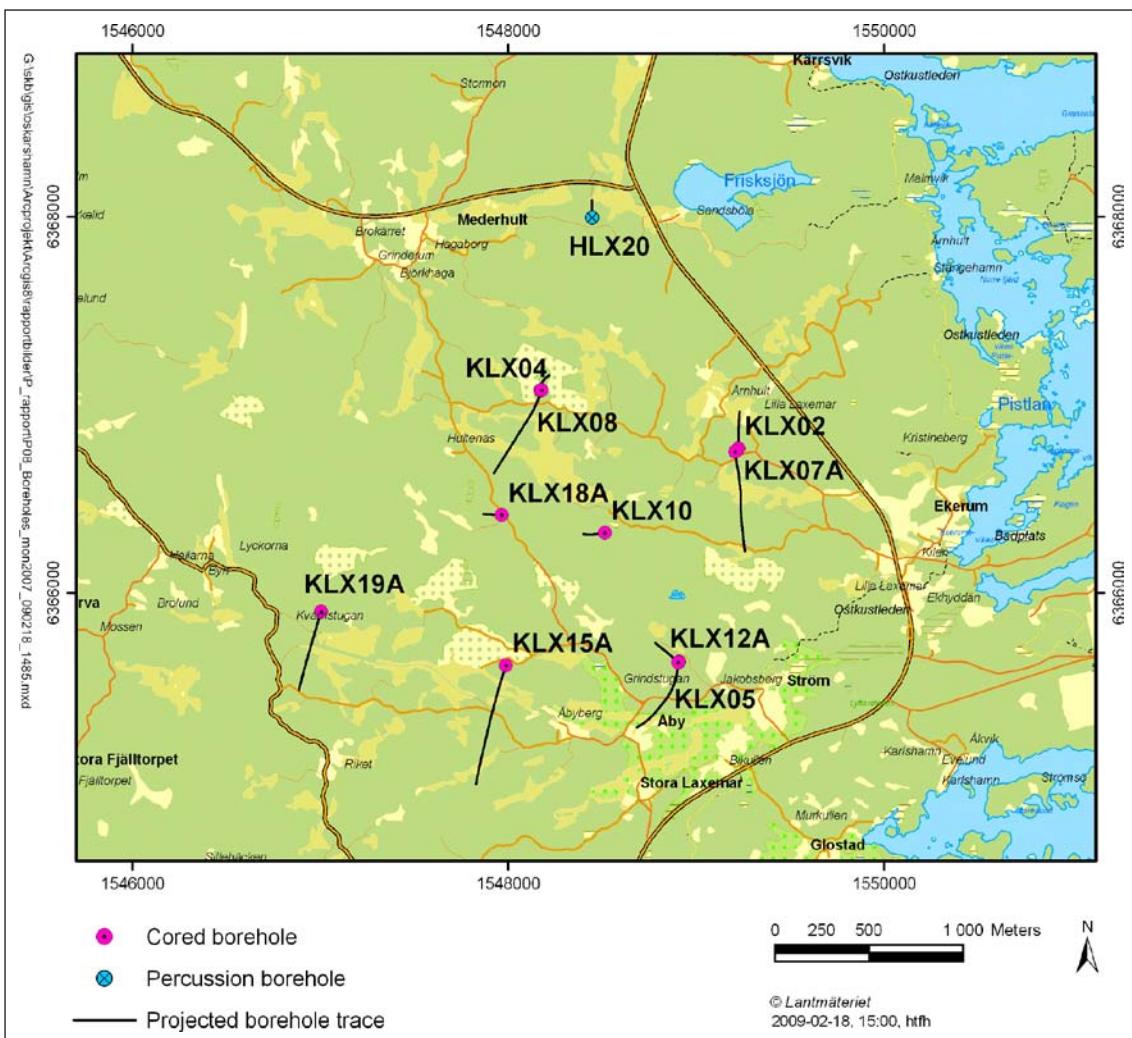

Figure 1-1. Overview of the Oskarshamn site investigation area. The following borehole sections was monitored during the summer period KLX02:2, KLX05:3, KLX05:7, KLX07A:2, KLX08:3, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3, KLX19A:3 and HLX20:2. The autumn sampling period included sampling of groundwater from KLX04:5, KLX05:7, KLX07A:2, KLX08:3, KLX08:4, KLX10A:2, KLX12A:2, KLX15A:3, KLX18A:3 and KLX19A:3.

2 Objective and scope

According to the general programme for the Oskarshamn site investigation, core and percussion drilled boreholes are to be monitored twice every year. The water sampling is performed in circulation sections that are sealed off using permanently installed packers. The objective of the hydrogeochemical monitoring programme is to determine ground water composition over time in selected borehole sections chosen for this purpose. Previous water sampling within the programme has been made since 2005.

Ground water sampling within the monitoring programme of 2007 was carried out in summer during June–August and in autumn during November–December. Throughout the summer period groundwater sampling was carried out in totally 11 sections, while the autumn sampling period included sampling of groundwater from 10 sections.

Apart from sending samples to laboratory for chemical analysis, field measurements of pH, temperature and conductivity were performed. Archive samples and sample portions not sent for analysis were stored in freezers and refrigerators.

2.1 Summer period

The following sections were sampled during the summer period:

- KLX02 section 2, 1,145 to 1,164 m.
- KLX05 section 3 and 7, 625 to 633 and 241 to 255 m.
- KLX07A section 2, 753 to 780 m.
- KLX08 section 3, 626 to 683 m.
- KLX10A section 2 and 5, 625 to 633 and 351 to 368 m.
- KLX12A section 2, 535 to 545 m.
- KLX18A section 3, 472 to 489 m.
- KLX19A section 3, 509 to 517 m.
- HLX20 section 2, 71 to 80 m.

Six (6) sections (KLX02:2, KLX05:7, KLX07A:2, KLX08:3, KLX19A:3, HLX20:2) were sampled once after 3–5 conversions.

Eight (8) sections (KLX05:3 stopped after the first time series sample due to low flow rate, KLX05:7, KLX07A:2, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3 and KLX19A:3 two times) were sampled in time series (chapter 4.3).

2.2 Autumn period

The following sections were sampled during the autumn period:

- KLX04 section 5, 507 to 530 m.
- KLX05 section 7, 241 to 255 m.
- KLX07A section 2, 753 to 780 m.
- KLX08 section 3 and 4, 626 to 683 and 594 to 625 m.
- KLX10A section 2, 689 to 710 m.
- KLX12A section 2, 535 to 545 m.
- KLX15A section 3, 623 to 640 m.
- KLX18A section 3, 472 to 489 m.
- KLX19A section 3, 509 to 517 m.

All sections during the autumn period were sampled in time series (chapter 4.3).

3 Equipment

3.1 Description of equipment

Groundwater sampling is performed in boreholes with permanently installed packers. The pump equipment used for the groundwater sampling is schematically presented in Figure 3-1.

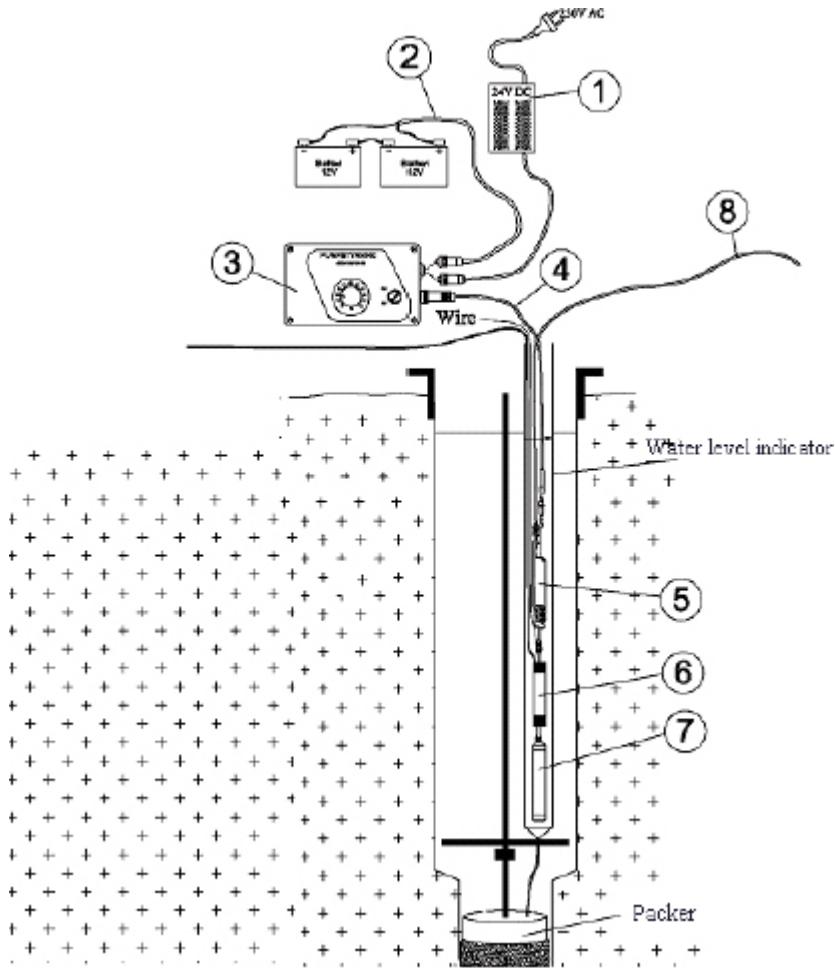

Figure 3-1. Schematic drawing of the equipment used for ground water sampling. 1. Battery eliminator 2. Battery cable 3. Pump control GEOPUMP UV 45 4. Pump cable 5. GEOPUMP UV 45 6. Mini packer 7. Filter holder with filter 8. Pump tube, polyamide 8/6 mm.

4 Execution

4.1 General

The activity was performed in accordance with the activity plan AP PS 400-07-044 including supplements. It also followed the method description SKB MD 368.010 (Mätsystembeskrivning (MSB) – Handhavande del, System för hydrologisk och meterologisk datainsamling. Vattenprovtagning och utspädningsmätning i observationshål. SKB internal document) and SKB MD 600.004 (Instruktion för rengöring av borrhålsutrustning och viss markbaserad utrustning. SKB internal document).

4.2 Preparations

The portable pH- and conductivity-meters were calibrated at the Äspö Laboratory every second week.

Sampling bottles belonging to the same sample portion was labelled with the same SKB sampling number. Acid washed bottles for analysis of main components and archive samples was prepared with 1 ml HNO₃ suprapur. Acid washed bottles for analysis of iron was prepared with 5 ml HCl suprapur.

Before installation of a pump in a borehole the functionality of the pump was checked using a bucket. To reduce the risk of particles entering the permanent installation in the boreholes, tubes and cables were placed on plastic sheaths. During the lowering of the pump into a borehole all visible particles on the tube and cable were wiped off. New tubes and pump filters were used in each borehole section.

4.3 Execution of field work

Water sampling in each borehole section was performed using identical pump equipment set-ups, as shown in Figure 3-1.

The method of water sampling during 2007 was gradually changed in comparison with previous years. During 2005, 2006 and part of 2007 sampling was made after 3–5 conversions. This means that the water volume in the tube, plus the volume in the section should be converted preferably five times, but at least three times before sampling.

The change in water sampling method from 3–5 conversions to time series sampling resulted in five sampling occasions instead of one for each borehole section.

During each of the first 3 sampling occasions a SKB chemistry class 3 including options was sampled after 1, 2 and 3 conversions respectively. After the third conversion field measurements of electric conductivity were performed until electric conductivity stabilised, then a fourth SKB chemistry class 3 including options was sampled. During the time series sampling the activity leader was updated on electric conductivity values and took part in the decision of when the fourth SKB chemistry class 3 including options should be sampled. After the fourth sampling of SKB chemistry class 3 including options a SKB chemistry class 5 including options was sampled. In most cases after one additional day. Field measurements of electric conductivity were performed until the last sample was taken.

During part of the autumn period 2007 analyse of HS⁻ and Fe(II)/Fe(tot) were added to the first four sampling occasions (KLX07A:2, KLX10A:2, KLX15A:3 and KLX19A:3).

Sampling in time series resulted in converted water volumes much greater than 3–5 conversions. To control the volume of groundwater pumped to the surface the flow was measured. The total delivered amount of water was collected in tanks. The tanks were later emptied onto the rinse slab at Simpevarp.

The water level in the borehole sections was logged in order to determine the maximal drawdown during the sampling period. The drawdown was generally not allowed to exceed 10 m.

Determination of density as well as field measurements of pH, temperature and conductivity were performed. After sampling the pumps were uninstalled.

Archive samples, as well as samples not analyzed due to high drill water content, were stored in a freezer. Some of the sample portions in each SKB chemistry class 3 (²H, ¹⁸O, ³H and main components) were stored in a refrigerator to enable future analyses if required.

4.3.1 Summer period

The first six (6) sections (KLX02:2, KLX05:7, KLX07A:2, KLX08:3, KLX19A:3, HLX20:2) sampled during the summer period were sampled after 3–5 conversions. In each of these six sections one SKB chemistry class 5 including options was sampled. Depending on drill water content, collected samples were analysed as SKB chemistry class 5, 3 or 2.

Eight (8) sections (KLX05:3, KLX05:7, KLX07A:2, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3 and KLX19A:3) were sampled in time series. KLX05:3 was stopped after the first sample occasion due to low flow rate. In KLX19A:3 time series sampling was made twice.

Groundwater sampling was performed in the 11 sections listed in Table 4-1.

Converted water volume, volume of water sample, drawdown, pump effect and flow rate for each borehole section are listed in Appendix 1 Table A1-1.

Events during field work, such as pump start, date and time of water sampling and field measurements of temperature, pH and electric conductivity are listed in Appendix 1 Table A1-2 to A1-16.

Pumping was performed twice in section KLX07A:2 and KLX05:7 and three times in KLX19A:3.

4.3.2 Autumn period

Sampling was made in time series in the same way as during the summer period. In four borehole sections (KLX07A:2, KLX10A:2, KLX15A:3 and KLX19A:3) HS⁻ and Fe(II)/Fe(tot) was sampled and analysed as additional options with each SKB chemistry class 3.

Groundwater sampling was performed in time series in the 10 sections listed in Table 4-2.

The water level in the borehole sections was logged in order to determine the maximal drawdown during the sampling period.

Converted water volume, volume of water sample, drawdown, pump effect and flow rate for each borehole section during the field work are listed in Appendix 1 Table A1-17.

Events during the field work, such as pump start, date of water sampling and field measurements of temperature, pH and electric conductivity are listed in Appendix 1 Table A1-18 to A1-27.

Table 4-1. Volume in tube and borehole section and the desired conversion volume.

Borehole section	Volume tube + section (L)	Volume x 3 (L)	Volume x 5 (L)
KLX02:2	43.8	131.3	218.9
KLX05:3	25.1	75.2	125.3
KLX05:7	16.2	48.5	80.8
KLX07A:2	34.9	104.7	174.5
KLX08:3	59.1	177.3	295.5

KLX18A:3	37.3	111.9	186.5
KLX19A:3	36.5	109.4	182.3
HLX20:2	138.5	415.4	692.4

Table 4-2. Volume in tube and borehole section and the desired conversion volume.

Borehole section	Volume tube+section (L)	Volume x 3 (L)	Volume x 5 (L)
KLX04:5	26.4	79.1	131.8
KLX05:7	16.2	48.5	80.8
KLX07A:2	34.9	104.7	174.5
KLX08:3	59.1	177.3	295.5
KLX08:4	48.8	146.3	243.9
KLX10A:2	31.1	93.3	155.6
KLX12A:2	23.2	69.5	115.8
KLX15A:3	58.0	173.9	289.9
KLX18A:3	37.3	111.9	186.5
KLX19A:3	36.5	109.4	182.3

4.4 Data handling

All data related to events during field work such as installation of pumps, water sampling and field measurements were noted in protocols. Before the protocols were handed over to SKB they were quality checked and signed by the responsible personnel.

Quality control of chemical analyse results were made by the responsible personnel before they were sent to SKB. A statistical evaluation showing results above and below the 90th and 10th percentile, as well as the 95th and 5th percentile, were conducted. In addition to the statistical evaluation calculation of charge balance errors (equation 4-1) were made and reported.

$$\text{Relative error (\%)} = 100 \times \frac{\sum \text{cations(equivalents)} - \sum \text{anions(equivalents)}}{\sum \text{cations(equivalents)} + \sum \text{anions(equivalents)}} \quad (\text{equation 4-1})$$

When the quality checked data are sent to SKB, routines for quality control and data management are applied.

Some of the constituents are determined by more than one method and/or laboratory. All analytical results are stored in the Sicada database. The applied hierarchy path “Hydrogeochemistry/Hydrochemical investigation/Analyses/Water in the database” contains two types of tables, raw data tables and primary data tables (final data tables).

Data regarding basic water analyses are inserted into the raw data tables for further evaluation. The evaluation results in a final reduced dataset for each sample. These data sets are compiled in a primary data table named “water composition”. The evaluation is based on:

- Comparison of the results from different laboratories and/or methods.
- Calculation of charge balance errors, (equation 4-1). Relative errors within $\pm 5\%$ are considered acceptable.
- General judgement of plausibility based on earlier results and experience.

All results from special analyses of trace metals and isotopes are inserted directly into primary data tables. In cases when the analyses are repeated or performed by more than one laboratory, a “best choice” notation will indicate those results which are considered most reliable.

An overview of the data management is given in Figure 4-1.

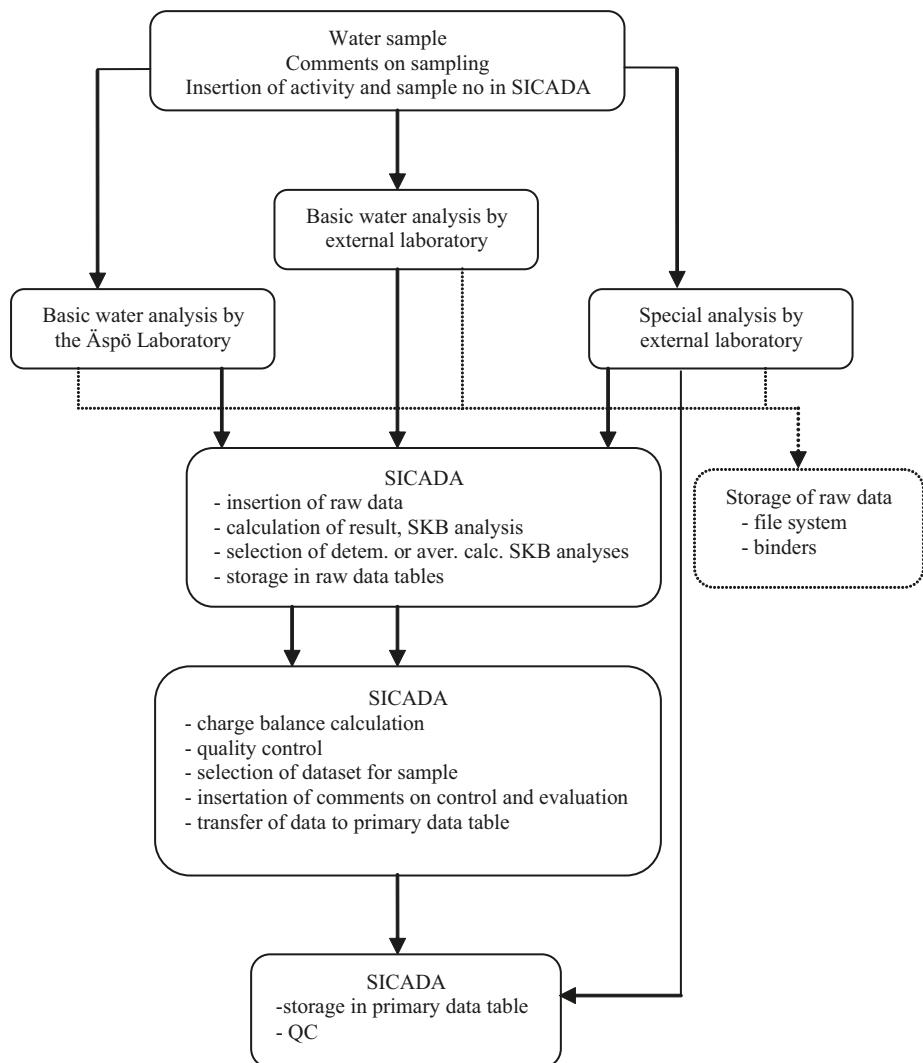

Figure 4-1. Overview of data management for hydrogeochemical data.

4.5 Water sampling, sample treatment and analyses

Water pumped from the borehole was conveyed from the tube into the sample bottles. A water sample is defined as groundwater collected on one occasion and consists of several sample portions, labelled with the same SKB sample number.

The sampling bottles for each SKB chemistry class 3 including options consist of:

- five 250 ml plastic bottles for pH, conductivity, anions, density and archive samples,
- three 100 ml plastic bottles; one for $^{2\text{H}}\text{ }^{18\text{O}}$, one for drill water (brown) and one acid washed for main components,
- one 500 ml plastic bottle for ^3H (dried),
- during the autumn period options for SKB chemistry class 3 was extended with two Winklerflasks for HS^- and one 500 ml plastic acid washed bottle for Fe(II)/Fe(tot). Four borehole sections (KLX10A:2, KLX19A:3, KLX07A:2, KLX15A:3) was sampled with this extended version of SKB chemistry class 3 during the autumn period.

The sampling bottles for each SKB chemistry class 5 including options consist of:

- eight 250 ml plastic bottles for pH, conductivity, anions, density, nutrient salts, TOC, DOC and archive samples,
- nine 100 ml plastic bottles; six for I^- , $^{2\text{H}}\text{ }^{18\text{O}}$, $^{87}\text{Sr}/^{86}\text{Sr}$, ^{13}C and drill water (brown) and three acid washed for main components and archive samples,
- three 500 ml plastic bottles; two for ^3H (dried) and ^{37}Cl and one acid washed for Fe(II)/Fe(tot),
- three 1,000 ml plastic bottles for ^{34}S , U/Th and Ra/Rn,
- two 50 ml flasks for NH_4 ,
- two Winklerflasks for HS^- .

Portioning into sample bottles, filtration and conservation of samples were performed in field.

An overview of sample treatment and analyse methods is given in Appendix 2 Table A2-1.

An overview of methods, reporting limits and uncertainties is given in Appendix 2 Table A2-2.

All analytical results are traceable by the activity plan number and the SKB sample numbers in the database Sicada.

4.6 Control analyses

Control analyses of main components, TOC, DOC and bromide has been made by sending a number of selected samples for analysis at two different laboratories.

4.6.1 Summer period

During the summer period two SKB sample numbers (11985 and 15031) were sent for control analyses of main components, TOC and DOC. Nine samples (SKB numbers 11917, 11918, 11923, 11943, 11985, 1197, 1198, 15029 and 15031) were sent for control analysis of bromide.

4.6.2 Autumn period

During the autumn period two samples (SKB number 15179 and 15242) were sent for control analyses of main components, TOC and DOC. Nine samples (SKB numbers 15155, 15156, 15179, 15190, 15191, 15192, 15242, 15243, 15244 and 15245) were sent for control analysis of bromide.

4.7 Nonconformities

4.7.1 Summer period

Sampling has gradually been made in time series instead of after 3–5 conversion. The change in sampling method resulted in five sample occasions for each borehole section, instead of one.

During the summer period pumping was stopped in borehole KLX05 section 3 after the first conversion due to low hydraulic conductivity and consequently low flow rate. The pumping was stopped because of problems keeping such a low flow rate continuously.

4.7.2 Autumn period

No nonconformities happened during the autumn period.

5 Results

Water chemistry data obtained within the hydrogeochemical monitoring programme during 2007 originate from ground water samples from KLX02:2, KLX04:5, KLX05:3, KLX05:7, KLX07A:2, KLX08:3, KLX08:4, KLX10A:2, KLX10A:5, KLX12A:2, KLX15A:3, KLX18A:3, KLX19A:3 and HLX20:2.

5.1 Chemical analyses

Results from the chemical analyses are presented below and in Appendix 3. The results are stored in the Sicada database and are traceable by the activity plan number AP PS 400-07-044 and the SKB sample numbers. It is only the data in the database that are accepted for further interpretation (modelling).

5.1.1 Summer period

Results from the summer period include water chemistry data for borehole sections KLX02:2, KLX05:3, KLX05:7, KLX07A:2, KLX08:3, KLX10A:2, KLX10A:5, KLX12A:2, KLX18A:3, KLX19A:3 and HLX20.

5.1.2 Autumn period

Results from the autumn period include water chemistry data for borehole sections KLX04:5, KLX05:7, KLX07A:2, KLX08:3, KLX08:4, KLX10A:2, KLX12A:2, KLX15A:3, KLX18A:3 and KLX19A:3.

5.2 Field measurements of electric conductivity

Due to the change in sample method, from 3–5 conversions to time series, electric conductivity became an important parameter. For each section field measurements of electric conductivity were made at least once a day and at every sample occasion.

5.2.1 Summer period

In Appendix 4 Figure A4-1 field measurement of electric conductivity is plotted versus date. Appendix 4 Figure A4-2 shows electric conductivity plotted versus minutes after pump start. Appendix 4 Figure A4-3 shows electric conductivity plotted versus pumped volume (L).

5.2.2 Autumn period

In Appendix 4 Figure A4-4 field measurement of electric conductivity is plotted versus date. Appendix 4 Figure A4-5 shows electric conductivity plotted versus minutes after pump start. Appendix 4 Figure A4-6 shows electric conductivity plotted versus pumped volume (L).

5.3 Sulphide analyses

Four (4) borehole sections during the autumn period were analysed for HS^- in the four first sample occasions. Appendix 5 Figure A5-1 shows HS^- concentration versus time (min) after pump start. Appendix 5 Figure A5-2 shows HS^- concentration plotted versus volume (L) after pump start.

5.4 Basic water analyses

The basic water analyses include Na, K, Ca, Mg, Si, Li, S, Sr, SO_4^{2-} , Cl^- , HCO_3^- , Br^- , and F^- . Furthermore, measurements were made of pH, electric conductivity, drill water content and density. The basic water analysis data and relative charge balance errors are compiled in Appendix 3 Table A3-1.

Values of pH from laboratory and field measurements, are compared in Figure 5-1 (summer) and in Figure 5-2 (autumn). All values are from the last sample occasion in each borehole section.

The sulphur in sulphate has been analysed with two different methods, as sulphur in sulphate using spectrophotometer and as total sulphur using ICP-AES. In Figure 5-3 the sulphur in sulphate are compared to the total sulphur content for the summer period 2007. In Figure 5-4 the sulphur in sulphate are compared to the total sulphur content for the autumn period 2007.

The chloride concentration is plotted versus the corresponding value of electric conductivity for both the summer and the autumn period in Figure 5-5. The plot shows one point that deviates from the other results, KLX12A:2 which was sampled during the autumn period.

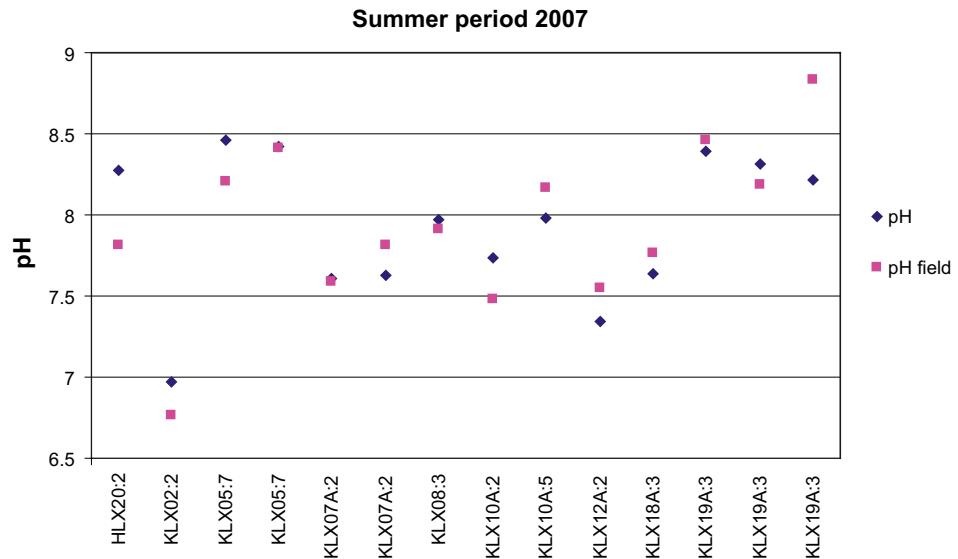

Figure 5-1. pH analysed at the Äspö Laboratory compared to pH measured in field for the last sampling occasion in each borehole section during the summer period.

Autumn period 2007

Autumn period 2007

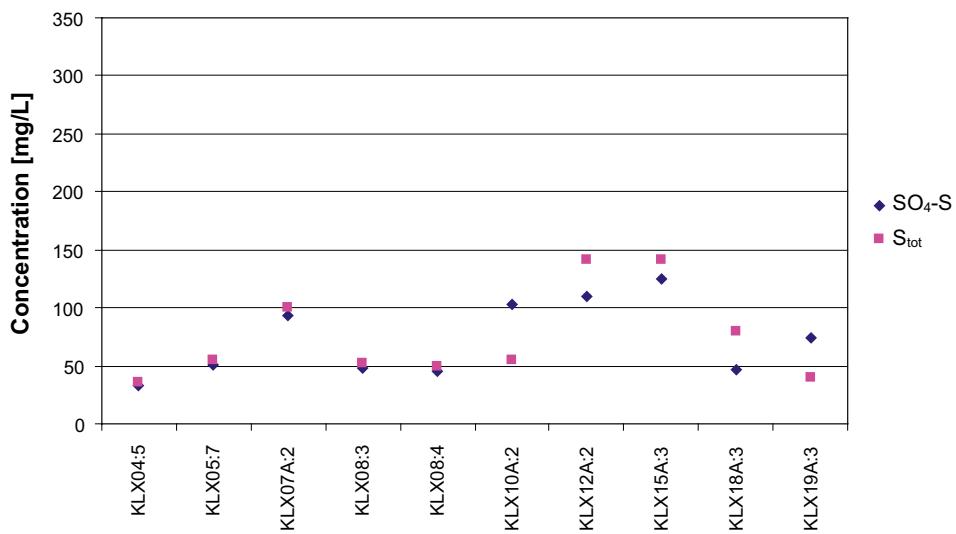

Figure 5-4. Comparison of sulphur in sulphate (analysed using spectrophotometer) with total sulphur content (analysed using ICP-AES) for investigated sections during the autumn period 2007.

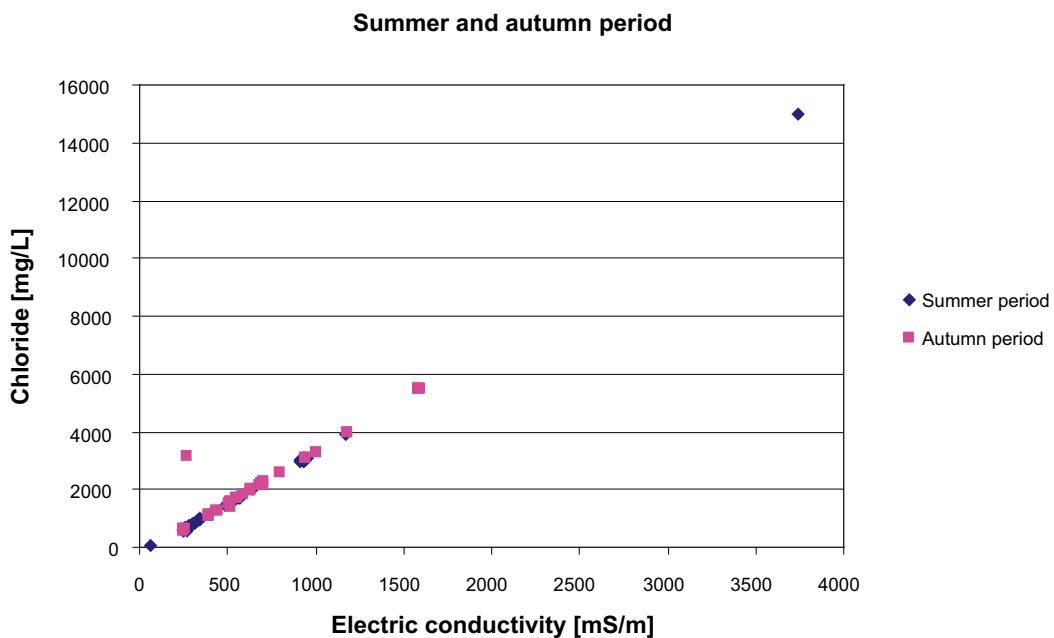

Figure 5-5. Chloride concentration plotted versus electrical conductivity for sampling conducted during the summer and autumn period.

5.5 Trace elements (rare earth elements and other)

The analyses of trace and rare elements include As, Ba, Cd, Ce, Cs, Dy, Er, Eu, Gd, Hg, Hf, Ho, In, La, Lu, Nd, Pr, Rb, Sc, Sm, Th, Tb, Tl, Tm, U, V, Y, Yb and Zr. Commonly occurring metals, such as Cu, Zn, Pb and Mo are not included in the analysis programme due to contamination considerations. The trace element data are compiled in Appendix 3 Table A3-2.

5.6 Stable and radioactive isotopes

The isotope determinations include stable isotopes as well as radioactive isotopes. The isotope data are compiled in Appendix 3 Table A3-3. The ^3H and $^2\text{H}^{18}\text{O}$ results from the monitored sections during the summer and autumn period are presented in Figure 5-6 and 5-7 respectively.

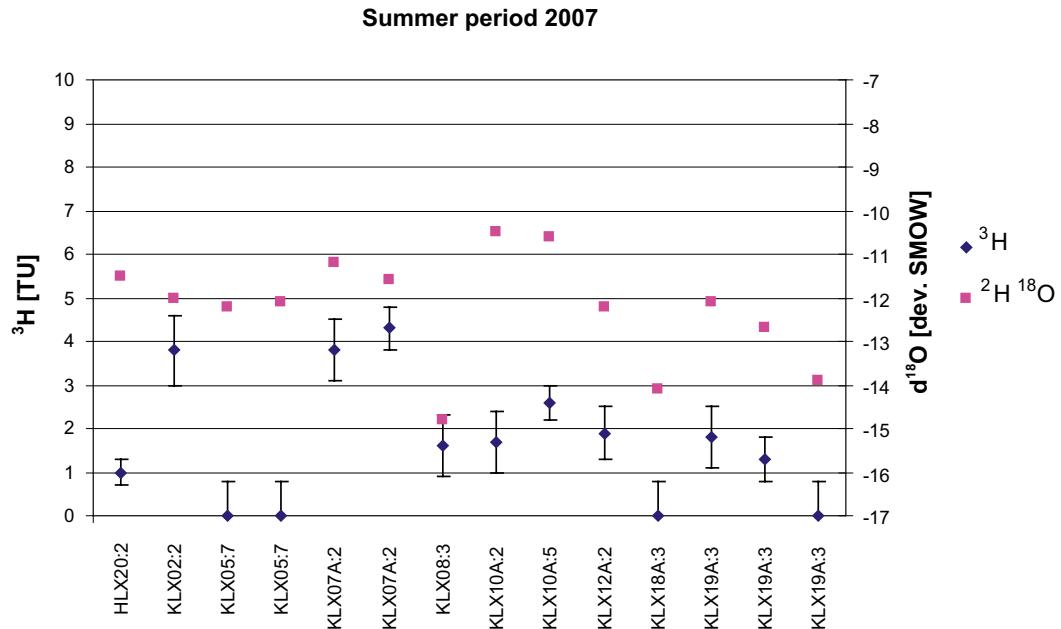

Figure 5-6. ${}^2\text{H}^{18}\text{O}$ and ${}^3\text{H}$ data from samples collected from the monitored sections during the summer period (error bars shows standard deviation).

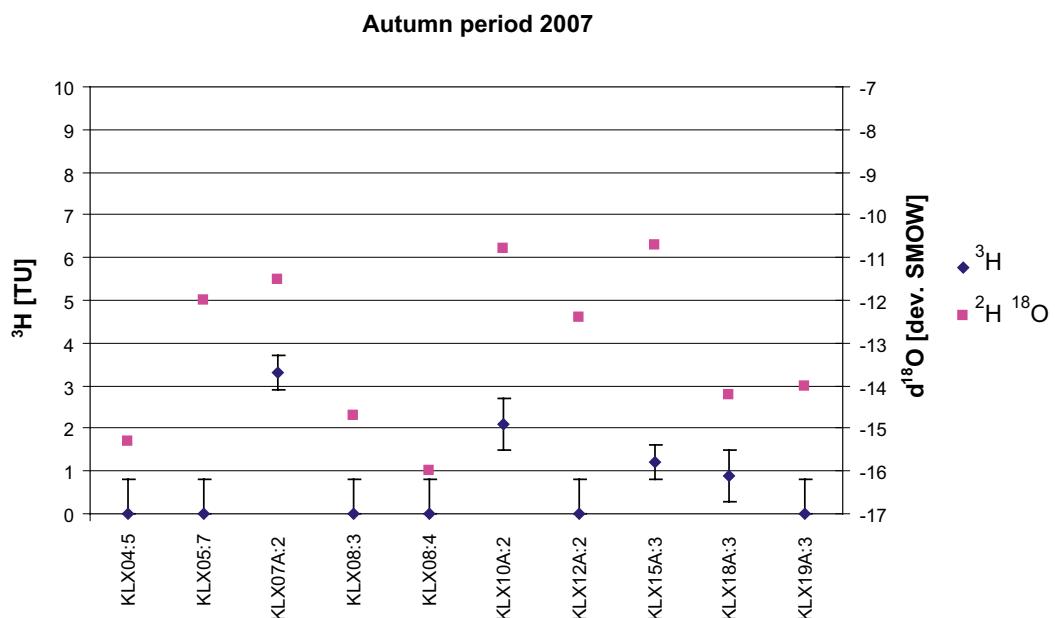

Figure 5-7. ${}^2\text{H}^{18}\text{O}$ and ${}^3\text{H}$ data from samples collected from the monitored sections during the autumn period (error bars shows standard deviation).

6 Summary

Two sample periods, summer and autumn, were carried out during 2007 and a total of 22 bore-hole sections were sampled. Sampling was conducted in accordance with SKB chemistry class 3 and 5. The sampling method was gradually changed, from sampling after 3-5 conversions to sampling in time series. When the sampling method changed electric conductivity became an important parameter, the last sample in each time series was sampled when electric conductivity was stable.

Field work and handling of samples have been quality controlled and documented according to given guidelines in the activity plan. During 2007 no accidents or other incidents took place that affected the quality of the performed field work and handling of samples negatively.

Obtained results have been quality controlled and the comparison of the results from different laboratories and/or methods showed agreement in most cases. The charge balance error exceeded the acceptable level of $\pm 5\%$ in two cases, for KLX04:5 (5.23%) and KLX10A:2 (5.13%).

Appendix 1

Sampling conditions and events during field work

Summer period

Table A1-1. Sampling conditions in borehole sections sampled during the summer period.

	KLX02:2	KLX05:3	KLX05:7*	KLX07A:2*	KLX08:3	KLX10A:2
Pumped, converted water volume (L)	180	35	77, 220	172, 750	250	319
Water sample, volume (L)	7.65	1.5	7.65, 12.7	7.65, 12.7	7.65	12.7
Maximal drawdown (m)	12	27	0.85, 1.45	0.3, 0.35	2.3	7.6
Maximum pump effect (%)	50	30	20, 35	90, 60	58	26
Maximum flow rate (L/min)	0.19	0.005	0.1, 0.26	0.4, 0.52	0.3	0.95

Sampling and analyse methods

Appendix 2

Table A2-1. Sample handling routines and analyse methods.

Component group	Component/element	Sample container (material)	Volume (ml)	Filtering	Preparation/Conservation	Analyse methods	Analysis within – or delivery time to lab	Included in SKB class
Drill water	Uranine	Plastic (brown)	100	No	No	Spectroflurometry	–	2,3,5
Anions	HCO ₃ pH (lab) cond (lab)	Plastic	250	No	No	Titration Pot.meas. Cond. meas.	The same day – maximum 24 h	2,3,5
	SO ₄ ²⁻ , Br ⁻ , F ⁻	Plastic	250	No	No	IC	Not critical (month)	3,5
	Cl ⁻					Titration	Not critical (month)	2,3,5
	Br ⁻ , I ⁻	Plastic	100	No	No	ICP-SFMS	Not critical (month)	5
Cations	Na, K, Ca, Mg, S(tot), Si (tot), Li, Sr, Fe, Mn	Plastic (acid washed)	100	Yes (0,47 µm)	Yes (1 mL HNO ₃ , suprapur)	ICP-AES/ICP-SFMS	Not critical (month)	3 (except Fe, Mn),5
Environmental metals	Al, As, Ba, Cd, Co, Cr, Cu, Hg, In, Mo, Ni, P, Pb, V, Zn					ICP-SFMS	Not critical (month)	5
Boron isotopes	¹⁰ B/ ¹¹ B*					ICP-SFMS	No limit	5
Lantanoids	Sc, Rb, Y, Zr, Sb, Cs, La, Hf, Tl, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, U, Th					ICP-SFMS	Not critical (month)	5
Fe(II), Fe (tot)	Fe(II), Fe(tot)	Plastic (PEH, acid washed)	500	Yes (0,47 µm)	Yes (5 mL HCl, suprapur)	Spectrophotometry	As soon as possible the same day	5
Hydrogen sulphide	HS ⁻	Glass (Winkler)	About 120×2	Yes (0,45 µm)	Yes (0.5 mL 1M ZnAc, 0.5 mL 1M NaOH)	Spectrophotometry	Immediatly or if conserved, a few days	5
Nutrient salts	NO ₂ , NO ₃ +NO ₂ , PO ₄	Plastic	250	Yes (0,45 µm)	No	Spectrophotometry	Short transportation time	5
				Frozen, transported in isolated bag				
	NH ₄	Glass (flask)	2×25	No	No	Spectrophotometry	Maximum 24 h	5

Component group	Component/element	Samplecontainer (material)	Volume (ml)	Filtering	Preparation/Conservation	Analyse methods	Analysis within - or delivery time to lab
Dissolved organic carbon	DOC	Plastic	250	Yes (0,45 µm)	No	Potassium peroxodisulfate (K ₂ S ₂ O ₈), sulfuric acid and UV oxidation and IR detection of carbon dioxide	Short transportation time
Total organic carbon	TOC	Plastic	250	No	No	Potassium peroxodisulfate (K ₂ S ₂ O ₈), sulfuric acid and UV oxidation and IR detection of carbon dioxide	Short transportation time
Environmental isotopes	δ ² H, δ ¹⁸ O	Plastic	100	No	No	MS	Not critical (month)
Tritium	³ H (enhanced)	Plastic (dry bottle)	500	No	No	LSC	Not critical (month)
Chlorine-37	δ ³⁷ Cl	Plastic	500	No	No	ICP MS	Not critical (month)
Carbon isotopes	δ ¹³ C, pmC (¹⁴ C)	Plastic (fluorescence)	2×100	No	No	(A)MS	A few days
Sulphur isotopes	δ ³⁴ S	Plastic	1,000	No	No	Combustion, Micromass Optima isotope MS	No limit
Strontium isotopes	⁸⁷ Sr/ ⁸⁶ Sr	Plastic	100	No	No	TIMS	Days or weeks
Uranium and Thorium isotopes	²³⁴ U, ²³⁵ U, ²³⁸ U, ²³⁰ Th, ²³² Th	Plastic (HPDE)	1,000	No	No	Chemical Separat. Alfa spectroscopy	No limit
Radon and Radium isotopes	²²² Ra, ²²⁶ Rn	Plastic (HPDE)	1,000	No	No	LSS	Immediate transport
Density	Density	Plastic	250	No	No	Pycnometer	-
Archive samples with acid	-	Plastic (acid washed)	2×100	Yes (0,47 µm)	Yes (1 mL HNO ₃ , suprapur)	-	Storage in freeze container
Archive samples without acid	-	Plastic	2×250	Yes (0,45 µm)	No	-	Storage in freeze container

* The B-isotope ratio is given as ¹⁰B/¹¹B (the result reported from the consulting laboratory). If the notation according to internatiol standart for environmental isotopes, ¹¹B/¹⁰B, it is necessary to invert the ¹⁰B/¹¹B value (1/¹⁰B/¹¹B).

Abbreviations and definitions:

IC	Ion chromatograph
ICP-AES	Inductively Coupled Plasma Atomic Emission Spectrometry
ICP-MS	Inductively Coupled Plasma Mass Spectrometry
ICP-SFMS	Inductively Coupled Plasma Sector Field Mass Spectrometry
MS	Mass Spectrometry
LSC	Liquid Scintillation Counting
(A)MS	(Accelerator) Mass Spectrometry
TIMS	Thermal Ionization Mass Spectrometry
LSS	Liquid Scintillation Spectroscopy

Table A2-2 (page 3 of 3). Methods, reporting limits and measurement uncertainties (updated 2008).

-
1. Many elements may be determined by more than one ICP technique depending on concentration range. The most relevant technique and measurement uncertainty for the concentrations normally encountered in groundwater are presented. In cases where two techniques were frequently used, both are displayed.
 2. Reporting limits (RL), generally 10×standard deviation, if nothing else is stated. Measured values below RL or DL are stored as negative values in Sicada (i.e. -RL value and -DL value).
 3. Measurement uncertainty reported by the laboratory, generally as ± percent of measured value in question at 95% confidence interval.
 4. Reporting limits at electrical cond. 520 mS/m, 1,440 mS/m and 3,810 mS/m respectively.
 5. Measurement uncertainty at concentrations 100×RL.
 6. Measurement uncertainty at concentrations 10×RL.
 7. Per mille deviation from SMOW (Standard Mean Oceanic Water).
 8. TU=Tritium Units, where one TU corresponds to a tritium/hydrogen ratio of 10–18 (1 Bq/L Tritium = 8.45 TU).
 9. Per mille deviation from SMOC (Standard Mean Oceanic Chloride).
 10. Per mille deviation from PDB (the standard PeeDee Belemnite).
 11. The following relation is valid between pmC (percent modern carbon) and Carbon-14 age:
$$\text{pmC} = 100 \cdot e((1950-y-1.03t)/8274)$$
 where y = the year of the C-14 measurement and t = C-14 age.
 12. Per mille deviation from CDT (the standard Canyon Diablo Troilite).
 13. Isotope ratio without unit.
 14. The following expressions are applicable to convert activity to concentration, for uranium-238 and thorium-232:
1 ppm U = 12.4 Bq/kg²³⁸U, 1 ppm Th = 3.93 Bq/kg²³²Th.
 15. Isotopes are often reported as per mill deviation from a standard. The deviation is calculated as:
$$\delta_{\text{yl}} = 1,000 \times (\text{K}_{\text{sample}} - \text{K}_{\text{standard}}) / \text{K}_{\text{standard}}$$
, where K= the isotope ratio and yl =²H, ¹⁸O, ³⁷Cl, ¹³C or ³⁴S etc.
-

Appendix 4

Electric conductivity during time series sampling

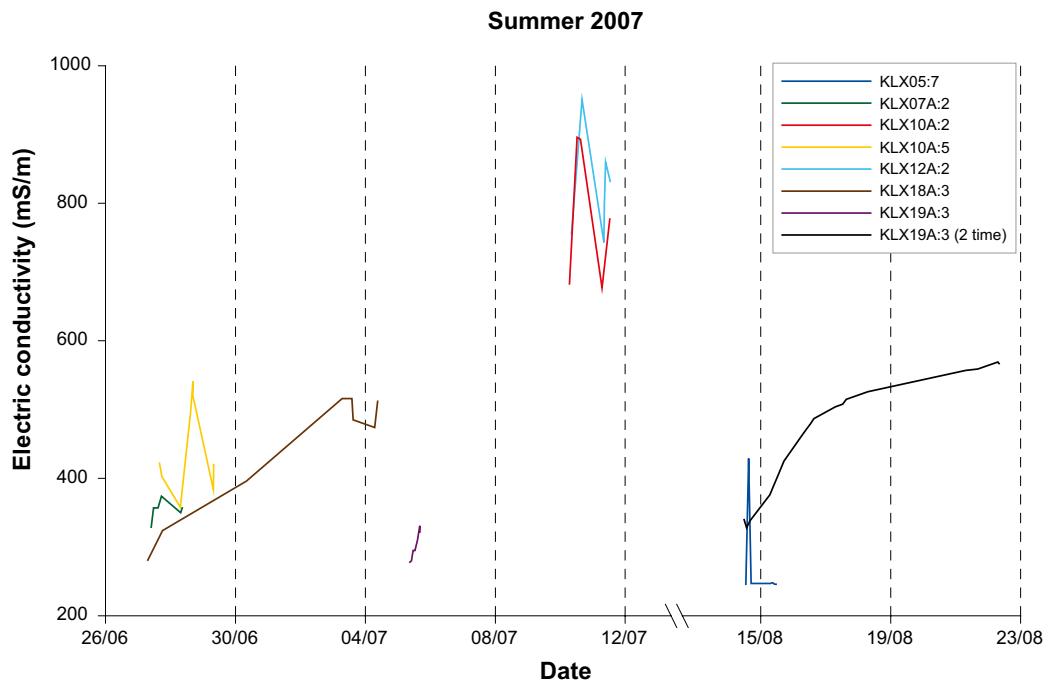

Figure A4-1. Field measurements of electric conductivity plotted versus date for borehole sections sampled during the summer period.

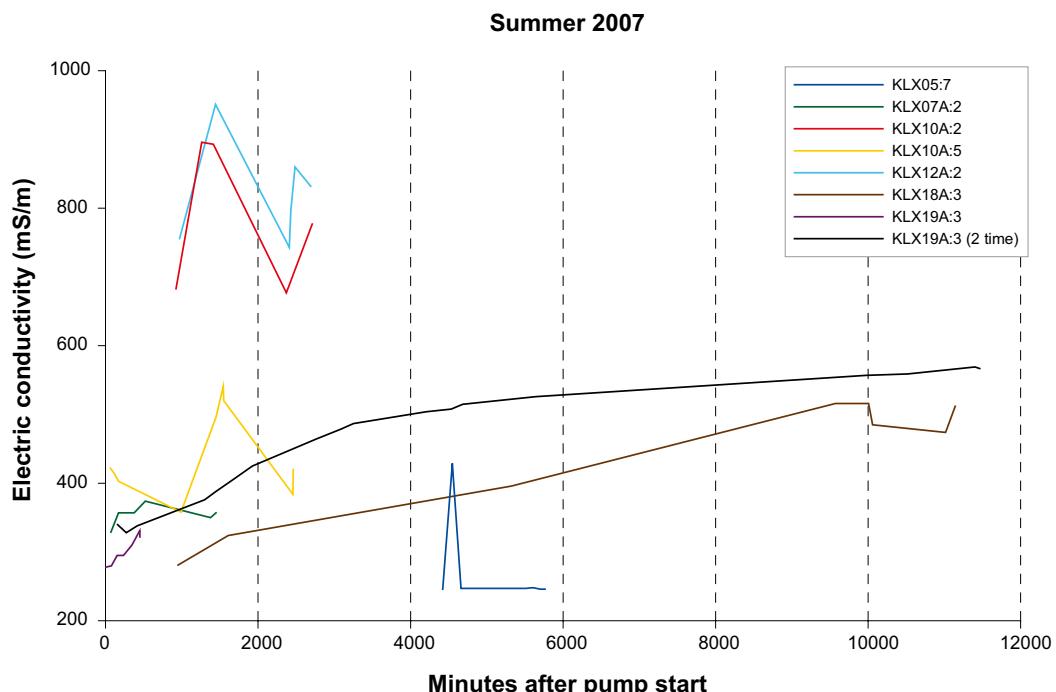

Figure A4-2. Field measurements of electric conductivity plotted versus minutes after pump start for borehole sections sampled during the summer period.

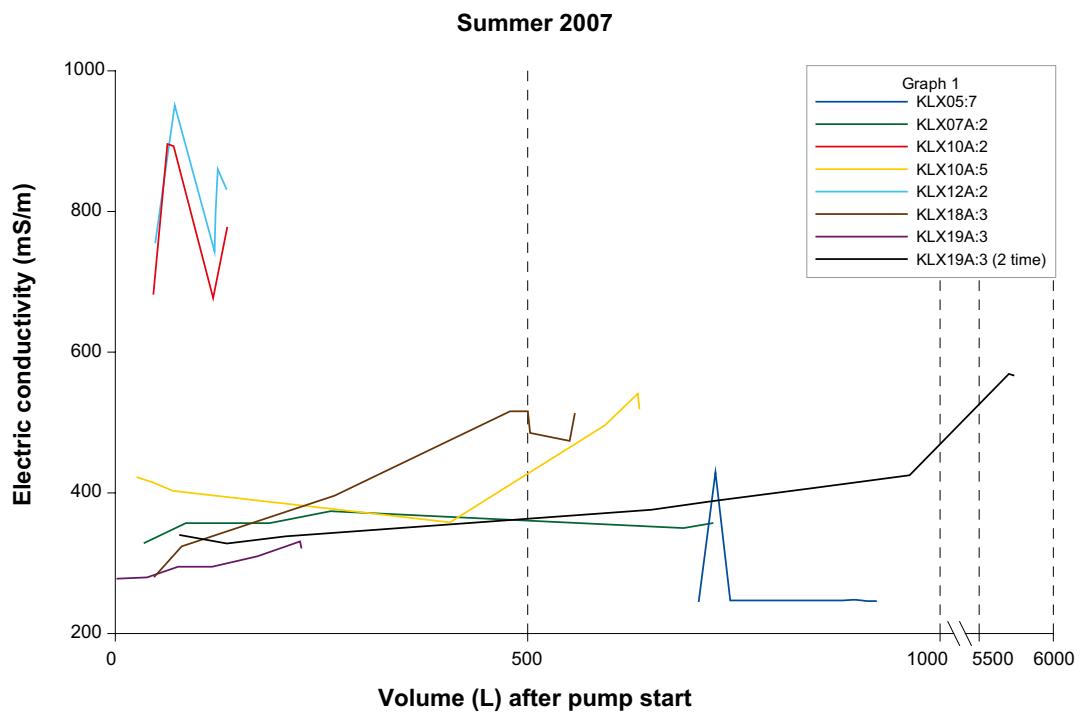

Figure A4-3. Field measurements of electric conductivity plotted versus volume (L) after pump start for borehole sections sampled during the summer period.

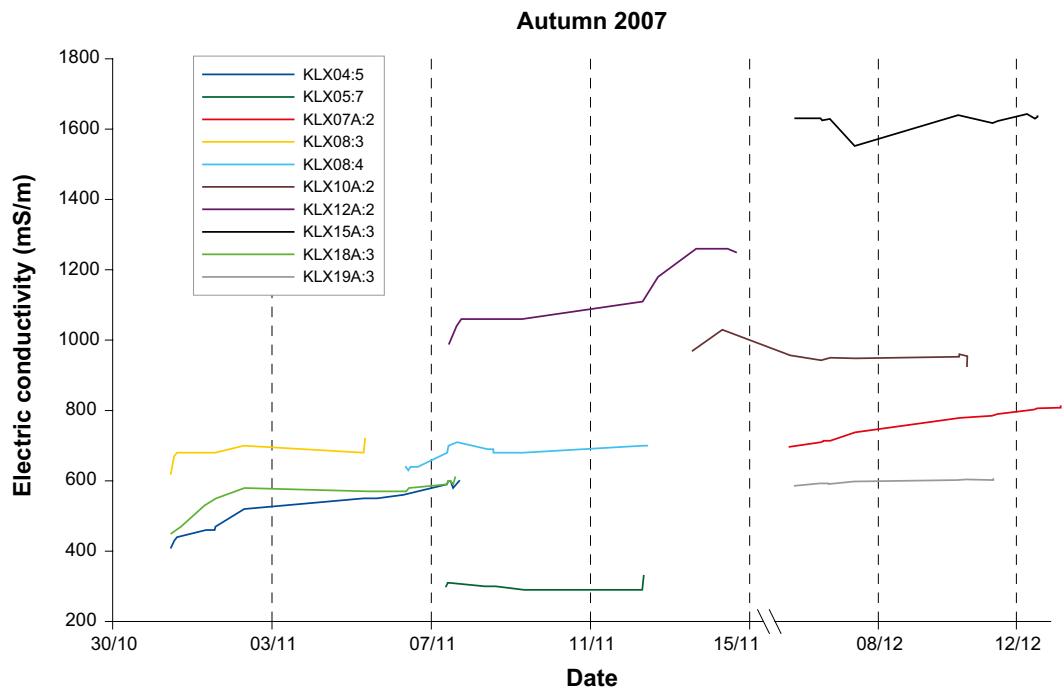

Figure A4-4. Field measurements of electric conductivity plotted versus date for borehole sections sampled during the autumn period.

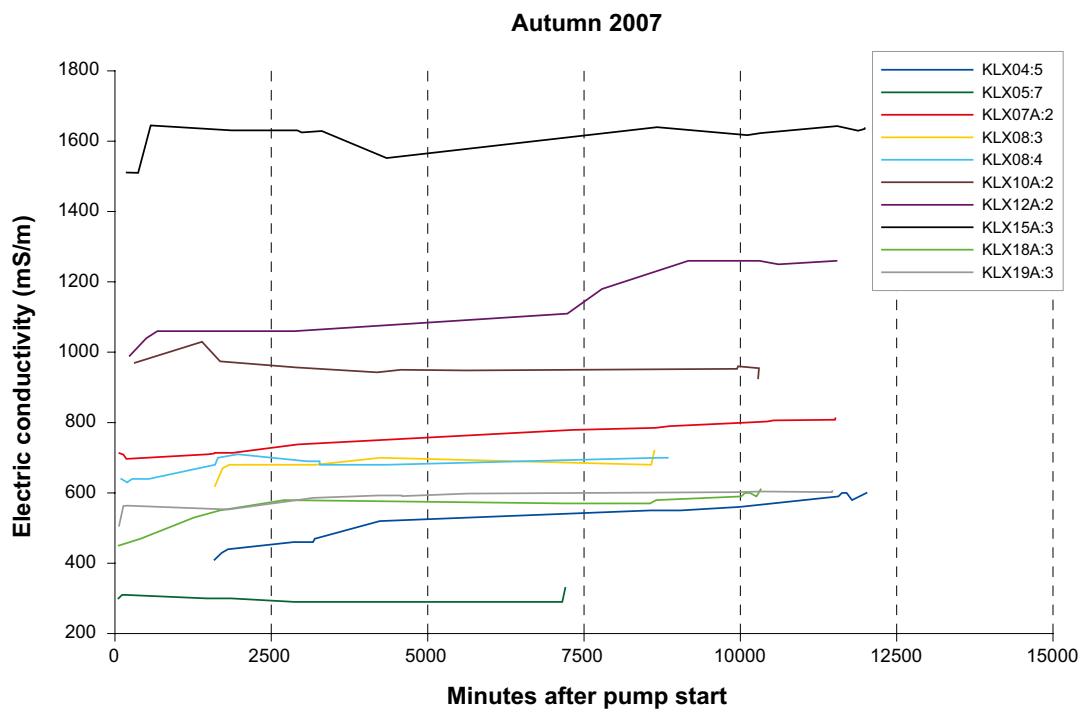

Figure A4-5. Field measurements of electric conductivity plotted versus minutes after pump start for borehole sections sampled during the autumn period.

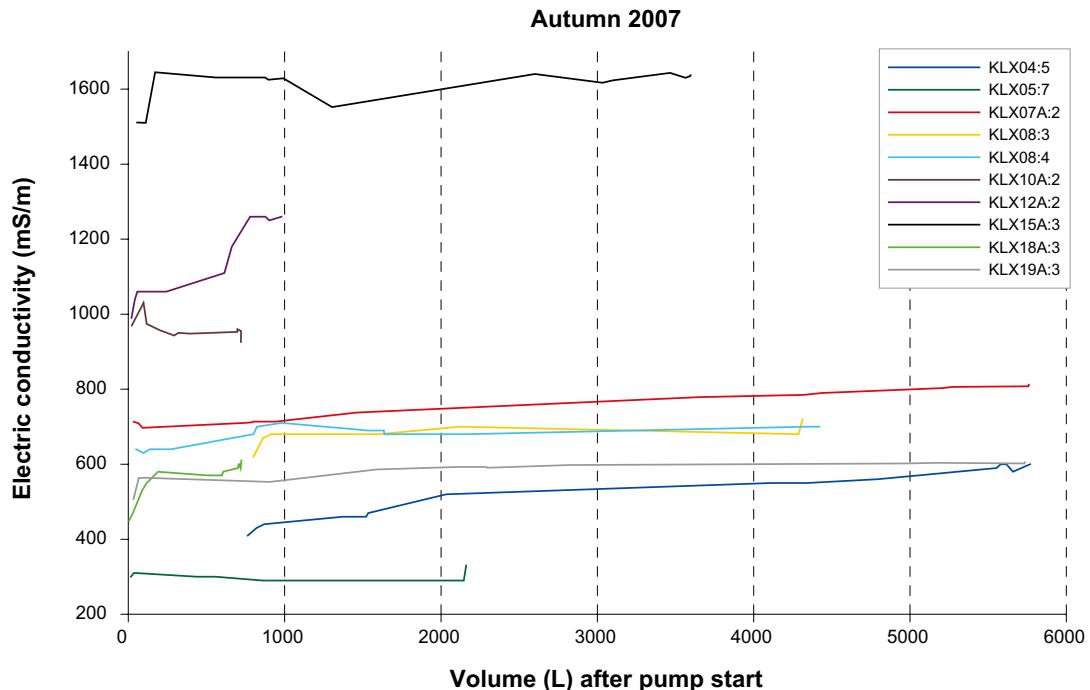

Figure A4-6. Field measurements of electric conductivity plotted versus volume (L) after pump start for borehole sections sampled during the autumn period.

Appendix 5

Sulphide during time series sampling

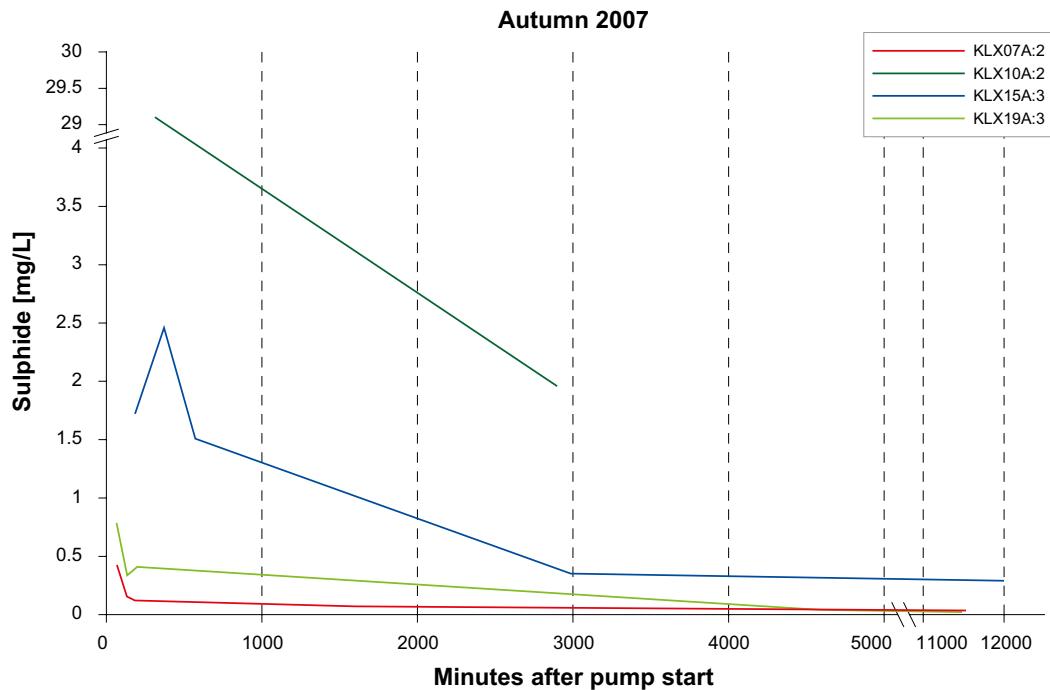

Figure A5-1. HS^- concentration (mg/L) plotted versus minutes after pump start.

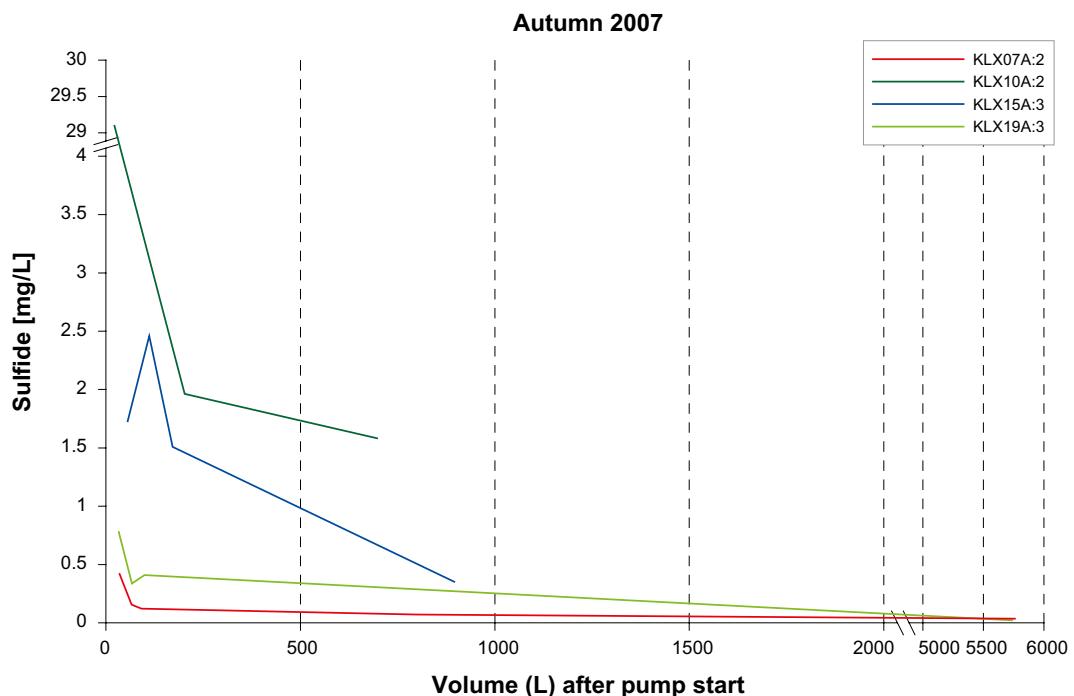

Figure A5-2. HS^- concentration (mg/L) plotted versus volume (L) after pump start.
