# 1 Introduction

This document reports the data obtained by surface water sampling and chemical analyses performed within the site investigation at Forsmark.

The activity is part of the geochemistry as well as the surface ecosystem programs. The surface water activity includes chemical analysis of water from lakes, running waters and shallow bays in the Forsmark area. Measurements of some physical parameters are also included.

Data from the field measurements are stored in the database SICADA directly after each field activity. The chemical analysis results are stored when delivered from the consulted laboratories. In this report field measurement data and chemical analysis data are included from the start in March 2002 until March 2003.

The sampling points are shown in Figure 1-1.

**Figure 1-1.** Sampling points in the surface water program. Points marked with crosses are alternatives for regular points (see Table 4-1).

## 2 Objective and scope

In order to characterise the surface water of the area, sampling was performed in lakes, running waters and shallow bays within and in connection to the investigation area. The activity includes water sampling for chemical laboratory analysis as well as field measurements of physical parameters.

Two different sampling programmes were performed, a main program and an extended program. The later one which includes additional parameters was performed four times during the period. In the extended program the number of parameters differs somewhat between running waters and lakes/bays (see Table 2-1). The main program was performed 15 times during the period. At the first sampling occasion, archive samples of 5 L were taken at each location. The surface water sampling occasions during 2002 are given in Table 2-2.

**Table 2-1. Parameters analysed in the main and the extended program, respectively.**

Program type	Parameters, laboratory analyses	Parameters, field measurements
Main program	Main components; cations (Na, K, Ca, Mg, Si, Li, Sr) and anions (Cl, SO <sub>4</sub> , F, Br), S <sub>tot</sub> , pH, conductivity, alkalinity, TOC, DOC/DIC, nutrient salts (NH <sub>4</sub> , NO <sub>2</sub> +NO <sub>3</sub> , Tot-N, PO <sub>4</sub> -P, Tot-P), silicate, Tot-N, Tot-P, chlorophyll a and c <sup>1</sup> , Pheophytin <sup>1</sup> , PON, POP, POC, oxygen, HS <sup>-2</sup>	Water temperature, Oxygen, pH, conductivity, salinity, Light <sup>1</sup> , Turbidity <sup>1</sup> , Water flow <sup>3</sup> , Water depth, water transparency <sup>1</sup>
Extended program, running waters	Analyses according to main program (except chlorophyll a and c and Pheophytin) and: Main components; cations (Fe, Mn) and anions (I), environmental metals (Al, As, Ba, B, Cd, Co, Cr, Cu, Hg, Mo, Ni, P, Pb, V, Zn), nutrient salts (NO <sub>2</sub> , NO <sub>3</sub> ), Fe(II), Fe(tot), <sup>3</sup> H, <sup>37</sup> Cl, deuterium, d <sup>18</sup> O, <sup>10</sup> B, <sup>87</sup> Sr, <sup>34</sup> S, <sup>13</sup> C, PMC	Water temperature, Oxygen, pH, conductivity, salinity, Light <sup>1</sup> , Turbidity <sup>1</sup> , Water flow <sup>3</sup> , Water depth, water transparency <sup>1</sup>
Extended program, lakes and bays	Analyses according to extended program, running waters and:Lanthanides (Sc, Rb, Y, Zr, I, Sb, Cs, La, Hf, Tl, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, U, Th), Chlorophyll a and c, Pheophytin, Isotopes of U, Th, Ra and Rn	Water temperature, Oxygen, pH, conductivity, salinity, Light <sup>1</sup> , Turbidity <sup>1</sup> , Water flow <sup>3</sup> , Water depth, water transparency <sup>1</sup>

<sup>1</sup> Not in running waters

<sup>2</sup> At reducing conditions

<sup>3</sup> Only in running waters

**Table 2-2. Surface water sampling occasions during the period March 2002–March 2003.**

Year	Month	Week	Program type*

### **3 Equipment and facilities**

#### **3.1 Description of equipment**

Water samples were collected using a “Ruttner sampler”. At the extended sampling occasions the sampler was washed in acid before use.

Measurements were initially performed with equipments measuring only one single parameter each, but during the year, two measuring sonds were bought. The smaller one, YSI 600 QS, measures pH, water temperature, oxygen, redox potential, conductivity, salinity and barometric pressure, and the larger one, YSI 6600, measures all the listed parameters above as well as turbidity, chlorophyll and PAR (Photosynthetic Active Radiation). The smaller sond was used for the first time during week 0236. During week 0246 the larger sond was also available and from then on the smaller one was used in running waters and the larger one in lakes and in the sea.

Water transparency was estimated using a Secchi disc and aquascope.

#### **3.2 Facilities for sample handling and analyses**

When the surface sampling activity started in March 2002 the facilities and equipment available for sample preparations, on site analyses (alkalinity, pH and electric conductivity), as well as sorting and packing sample bottles before delivery to different consulted laboratories, were limited and primitive. The facilities have been improved successively since then. The following facilities are now available and are used not only for the surface water sampling activity but for all water sample preparations and water analysis work:

- A small house inside the core mapping accommodation (“Lentab-hallen”) is used for work that has to be carried out in a very clean surrounding like analyses, division of samples into sample portions, filtering and acid additions.
- Part of the core mapping accommodation is reserved for hydrochemical work and equipped with long benches for sorting and packing sample bottles, cupboards for storing bottles, chemicals and other articles, two refrigerators and a freezer for storing samples and reagents. Water and nitrogen gas are available.
- Freeze container for storage of archive samples.
- Laboratory wagon with analytical instruments, vent hood and system for deionised water.

## 4 Performance

The method for sampling and analyses of surface waters is described in SKB MD 900.004 (Metodbeskrivning för ytvattenprovtagning vid platsundersökningar). The activity was performed according to Activity plan, SKB AP PF 400-02-07 (SKB internal controlling document). This section deals mainly with some deviations from the Activity plan.

### 4.1 Sampling points and sampling occasions

The regular and alternative sampling points are presented in Table 4-1. It was not always possible to collect samples at all the sampling points, and in Table 4-2 the reasons for deviations from the original sampling scheme are stated.

**Table 4-1. Sampling points and sampling occasions.**

Explanations for the abbreviations used in Table 4-2:

- X: Sample taken
- a): Test session, comparing with WTW-sonds
- b) YSI 6600 on repair
- C: no sample, due to weak ice
- D: no sample, due to sensitive wildlife
- E: no sample, as it was dried out, or too little water to take an representative sample
- F: no sample, due to no boat and/or weak ice
- g): Sample taken on another position, "close by", due to weak ice, only surface sample
- h): Sond measurements were performed and data logged
- i): Mixed water sample from 10 sampling sites in the lake

## **4.2 Water sampling and measurements**

### **4.2.1 Calibrations**

The measurement equipment was calibrated prior to each sampling occasion. The sonds were initially calibrated each day during the measuring campaigns, but starting week 0248 (021125) calibration was performed at the first day only, except for oxygen, which was calibrated every day.

### **4.2.2 Performance of field work**

Details about deviations concerning the field work are compiled in Table 4-3.

**Table 4-3. Notes/comments on measurements/water sampling. See explanations on next page.**

week/year	12/02	14/02	16/02	19/02	20/02	22/02	24/02	26/02	29/02	33/02	36/02	38/02	40/02	43/02	46/02	48/02	51/02	3/03	8/03

PFM00127	F13-100																		

Explanations for the abbreviations used in Table 4-3:

- a): Test session, only comparing data with WTW-sonds
- b: YSI 6600 not used – repair, no logged data for Turbidity, Chlorophyll and PAR
- C: Minor sond problem – but data logged
- D: Water transparency estimated without aquascoope.
- E: Very low water level, sample taken, but risk to get particles/contamination in the sample
- F: No flow estimation
- G: No flow, nearly dried out, sample taken in small “pond”
- H: Stagnant water or nearly stagnant water – no flow estimation, flow approx 0 m<sup>3</sup>/s
- I: Wrong depth values logged in YSI 6600 – reason probably freezing sensor
- J: Unlogic PAR-values in one or several depths caused probably by shadow from boat
- K: Sample taken at another position, “close by”, due to weak ice, only surface sample.
- L: Unlogic sonddata probably due to freezing sensors
- M: Transect data logged more shallowly than usual due to low water
- N: No water transparency estimated due to darkness. PAR-values uncertain due to darkness
- O: Risk for contamination from melting icewater, mainly in surface samples
- P: PAR-value should be rejected – too shallow to get the sensor under water
- Q: Mixed water sample from 10 sampling sites in the lake.
- R: No water transparency estimated
- S: Negative redox values despite presence of oxygen
- T: PAR 0-values couldn't be estimated just below surface due to thick ice
- U: Negative Turbidity values

### 4.3 Sample preparation and chemical analyses

An overview of present sample preparation routines, analytical methods and consulted laboratories is given in Appendix 1, Table A1-1 and A1-2. Some of the analyses were performed by other laboratories when the sampling program/activity started. The changed laboratories are listed in Table A1-3. Reporting limits and measurement uncertainties are given in Table A1-4. Some of the sample treatment routines have been improved during the time period in question as described below:

- Environmental and trace metals:

When the sampling program started in March 2002 it was considered desirable to avoid filtering of the samples outdoors in the field (too labour-demanding), and the water portions for ICP analyses were filtered and acidified after return to the location for sample preparation and packing. Later on, starting in September, it was found safer from contamination aspects to do the filtering outdoors at the sampling occasion. Disposable filters, disposable syringes and bottles prepared with acid were from now on used in the field.

- DOC and DIC:

Quite a number of the DOC (Dissolved Organic Carbon) values were found to be higher compared to the corresponding TOC (Total Organic Carbon) values for the same samples. A change-over from filtering of the DOC/DIC sample portions after the return from field to filtering immediately outdoors using disposable filters and disposable syringes was done in order to exclude the sample handling as a reason for the inconsistent results.

- Particulate nitrogen, phosphorous and carbon:

When the sampling program started, the facilities for sample preparation was very limited and the filtering for the determinations in question was therefore performed by the consulted laboratory. The sample bottles were stored cold (not freezing) and dark and were delivered to the laboratory the day after the sampling occasion. Suitable location and filtering equipment was available by the end of May 2002.

## 4.4 Data handling

### 4.4.1 Field measurement data

The data from field measurements are incorporated in SICADA directly after termination of the activity. A number of protocol versions have been used, as improvements have been successively incorporated during the period. From week 0251 the data files from the instruments were modified. A specific excel-macro was developed and the data files were than incorporated digitally into SICADA.

### 4.4.2 Chemical analyses data

The following routines for quality control and data management are generally applicable for hydrochemical data, independent of sampling method or sampling object.

Several components are determined by more than one method and/or laboratory. Moreover, control analyses by an independent laboratory are performed routinely on each fifth or tenth collected sample.

All analytical results are stored in the SICADA database. The applied hierarchy path Hydrochemistry/Hydrochemical investigation/Analyses/Water in the database contains two types of tables, raw data tables and primary data tables (final data tables).

Data on *basic water analyses* are inserted into raw data tables for further evaluation. The evaluation results in a final reduced data set for each sample. These data sets are compiled in a primary data table named “water\_composition”. The evaluation is based on:

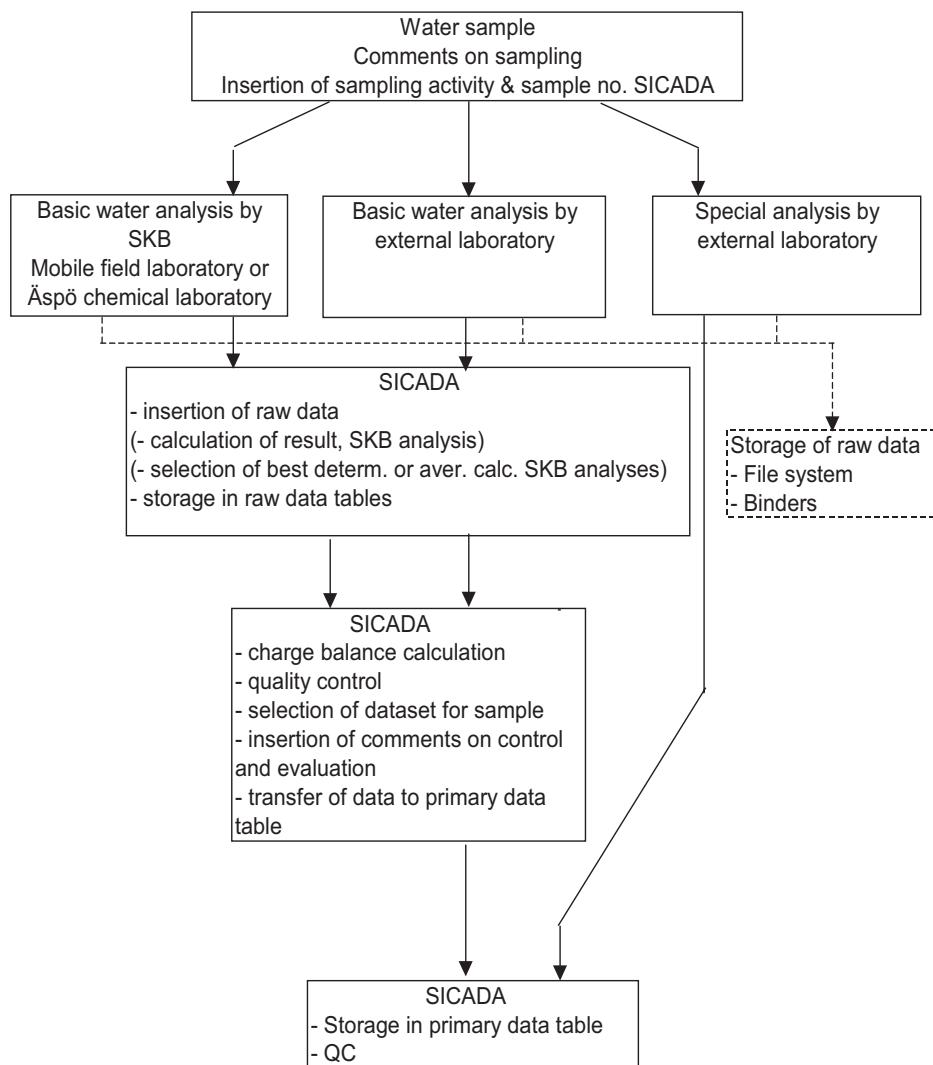

- Comparison of the results from different laboratories and/or methods. The analyses are repeated if a large disparity is noted (generally more than 10%)
- Calculation of charge balance errors. Relative errors within  $\pm 5\%$  are considered acceptable (in surface waters  $\pm 10\%$ )

$$\text{Rel. error (\%)} = 100 \times \frac{(\sum \text{cations(equivalents)} - \sum \text{anions(equivalents)})}{(\sum \text{cations(equivalents)} + \sum \text{anions(equivalents)})}$$

- General expert judgement of plausibility based on earlier results and experiences

All results from “*biochemical*” components and special analyses of trace metals and isotopes are inserted directly into primary data tables. When analyses are repeated or performed by more than one laboratory, a “best choice” notation will indicate those results which are considered most reliable.

An overview of the data management is given in Figure 4-1.

**Figure 4-1.** Overview of data management, chemical analysis results.

#### 4.4.3 Other relevant information and data

Some parameters are not measured with instruments. Those data can be found in a separate table in SICADA together with information about the weather conditions at the sampling occasions. The table is called “Weather\_data” and contains the following columns:

- Air temperature
- Cloudiness
- Precipitation
- Wind velocity
- Wind direction
- Light penetration (lakes and sea)
- Water flow (running waters)
- Snow/ice depth

These data are not presented in this report.

## 5 Results

### 5.1 General

The lakes in the Forsmark area have been studied by the Department of Limnology at Uppsala University during a couple of years. According to their report SKB R-99-68 /2/ Lake Eckarfjärden and Lake Fiskarfjärden can be classified as oligotrophic hardwater lakes. Our results show that this classification is also valid for the other investigated lakes in the area which are all small and shallow, with nutrient poor and highly alkaline water. The lakes are to a large extent surrounded by mires. The term "oligotrophic" refers to the nutrient status of the lake water, meaning nutrient poor. According to the Swedish Environmental Protection Agency (Naturvårdsverket) /3/ oligotrophic lakes are characterized by levels of total phosphorous below 12.5 µg/l and levels of total nitrogen below 300 µg/l (see Table 5-1).

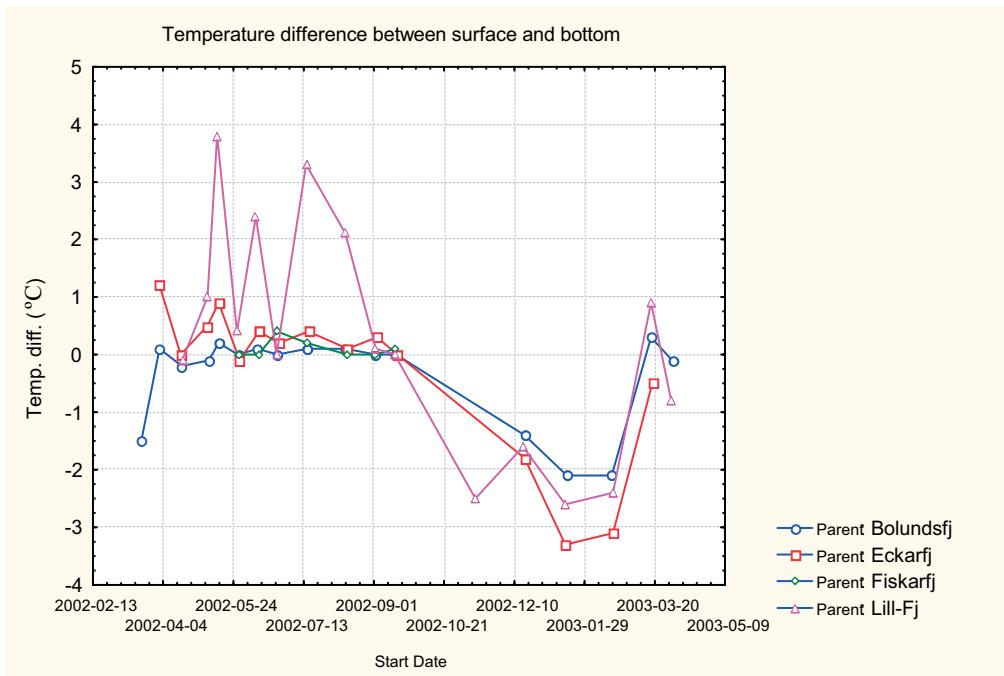

Hard-water lakes occur all over the world, in areas of alkaline sedimentary rocks. These rocks are easily weathered giving rise to alkaline water rich in calcium and many other elements serving as micro-nutrients for the biota. The amount of nutrients transported to the lakes may, however, be effectively reduced due to chemically as well as biologically induced interactions. In oligotrophic lakes, such as those in the Forsmark area, phosphorous is most often the limiting nutrient. The high pH-value, together with low water depth, favors a special aquatic biotic life.

**Table 5-1. Classification of lakes depending on nutrient status, according to Naturvårdsverket /3/.**

Class	Term	Tot-P (µg/l)	Tot-N (µg/l)
1	Oligotrophic	≤12.5	≤300
2	Mesotrophic	12.5–25	300–625
3	Eutrophic	25–50	625–1250
4	Eutrophic	50–100	1250–5000
5	Hypereutrophic	≥100	≥5000

### 5.2 Water profiles

The lakes and sea bays in the area are shallow; the deepest sampling point in the sea is about 5 m whereas the depth at the sampling points in lakes varies between 0.5–2.5 m. *In situ* measurements of different parameters were performed in profiles with interspaces of 0.5 m throughout the water column at each sampling site. Water samples were taken from the surface (0.5 m depth) as well as from approximately 0.5 m above the bottom. Comparisons of data from different depths reveal, with a few exceptions, a non-stratification status of the water, which is not surprising keeping in mind the limited water depth. Temperature stratification may however occur during periods with ice cover. If stratification occurs in the lakes during other periods, it is usually weak and stirring is easily induced by winds. In Figure 5-1 a comparison between water temperature for bottom and surface water respectively is plotted, as an example of this lack of stratification.

**Figure 5-1.** Difference between water temperature measured at the bottom and at the surface in four lakes. Stratification of the water occurred during the winter and for Lake Lillfjärden also occasionally during the spring.

The original results are stored in SICADA and data for modelling or other activities should be taken from the database. The data concerning the field measurements can be found with these Field Note numbers: Forsmark 7, 9, 16, 18, 23–25, 33, 36, 40, 43, 48, 51, 53, 65, 66, 83, 102.

## 5.3 Chemical analyses

The results of the chemical analyses are continuously stored in the database SICADA as soon as they are reported from the consulted laboratories. Data available in SICADA 2003-04-01, regarding samples collected before 2003-03-01 are included in this report. For some special analyses, as for example Carbon isotopes, the period between sampling and completed analysis is very long. Therefore, the reported data sets were not quite complete at the end of the investigation period. Missing data will be presented in coming reports.

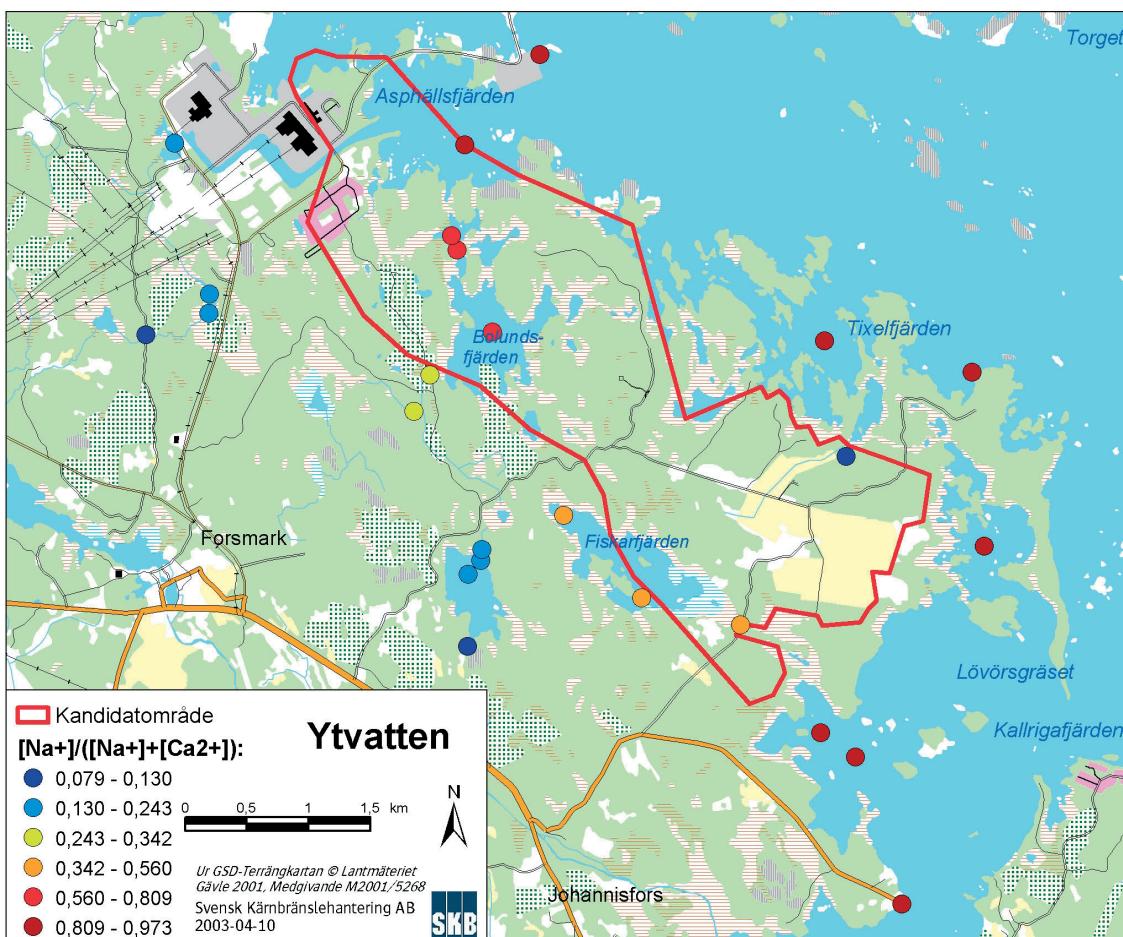

### 5.3.1 Major components

The results of the chemical analyses (major components) of samples collected from March 2002 to March 2003 are compiled in Appendix 3.

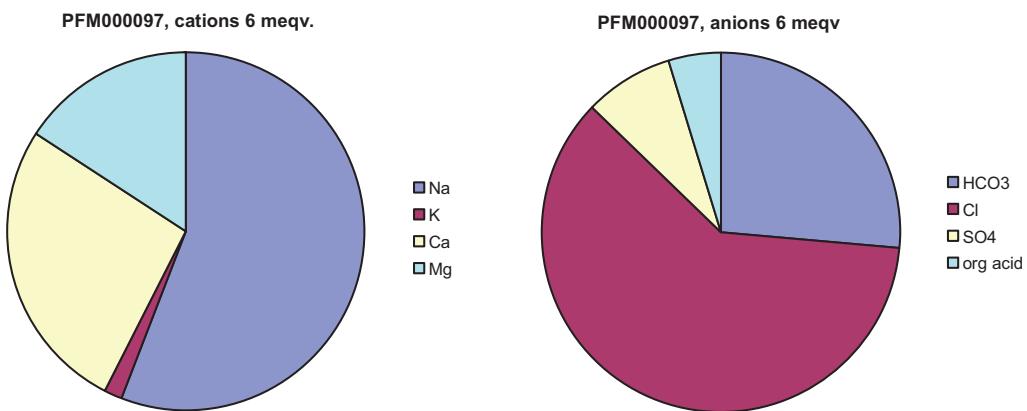

The fresh waters in the Forsmark area are generally well buffered with high alkalinity, high pH and high Calcium concentrations. Further, it is not a very long time ago since the area was lifted up above sea level, and waters recently affected by brackish sea water show high Sodium chloride concentrations. In Figure 5-2 the different character of the waters are represented by a scale from blue to red colour indicating low to high sodium concentrations. The lakes represented by red and orange sampling points were shallow bays less than one hundred years ago.

The high Calcium concentration and the high alkalinity are explained by weathering of limestone rich till prevailing in the area. The Sodium chloride concentration in the lakes and streams varies depending on the recentness of the contact with sea water. North of Bolundsfjärden, the threshold towards the sea is low, and brackish seawater probably still transgresses from time to time.

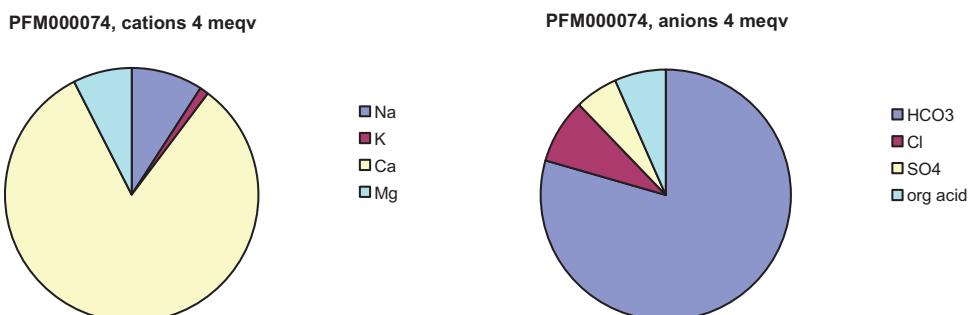

Generally, the amounts of ions in the fresh waters in the area are very high, especially the Sodium chloride type of waters. The circle diagrams below show the proportions of different major ions in lake water with a high sodium content (Figure 5-3) and in lakes with a more normal sodium concentration (Figure 5-4). The proportions of major ions in a lake situated in the Simpevarp area are given as a comparison (Figure 5-5). In this surface water with a low amount of ions, the organic acids constitute about one third of the negatively charged ions.

**Figure 5-2.** Overview of sampling points. Type of water is indicated by a scale from blue to red for waters with low and high Sodium concentration, respectively.

**Figure 5-3.** Example of ion charge balance in a lake in the Forsmark area periodically affected by sea water (Norra Bassängen).

**Figure 5-4.** Example of ion charge balance in a lake in the Forsmark area with no recent contact with sea water (Labboträsket).

**Figure 5-5.** Example of ion charge balance in a surface water with a low amount of ions, i.e. from a low-alkaline area. The diagrams are enlarged almost twice compared to the scale applied in Figures 5-3 and 5-4 (Kvarnstugan, streaming water).

The brackish sea water sampled close to land in the Forsmark area display for sea water typical proportions of the major components, except for the Calcium to Chloride factor, see Table 5-1. The proportions of major components are known to be practically the same in all sea water, independent of if the salt content is high or low (in the Atlantic ocean as well as in the Baltic sea) /4/ /5/. The high and varying Calcium to Chloride factor in the brackish sea water around Forsmark is probably due to the fact that the sampling points are all situated close to land and affected by discharge of fresh water with high Calcium concentrations. Besides Calcium, the calculated proportions deviate less than  $\pm 10\%$  from literature values for the Baltic Sea. These smaller deviations are not significant and can be explained by the size of the analytical error.

**Table 5-1. Proportions of major ions in sea water and brackish water (literature values and results from the surface water sampling activity in Forsmark)**

Proportions	Ocean water /4/	Brackish water, the Baltic sea /4/	"PLU results", brackish water, coastline outside Forsmark candidate areaAver. and stdev. of 122 samples
Na/Cl	0.556	0.556	0.550 ± 0.032
SO <sub>4</sub> /Cl	0.139	0.139	0.139 ± 0.004
Mg/Cl	0.067	0.069	0.068 ± 0.004
Ca/Cl	0.0216	0.0255	0.0355 ± 0.0396

### 5.3.2 Nutrient salts, silicate and organic carbon

The data on “biochemistry related” components (nutrient salts, silicate and organic carbon) obtained during the time period March 2002 to March 2003 are compiled in Appendix 4.

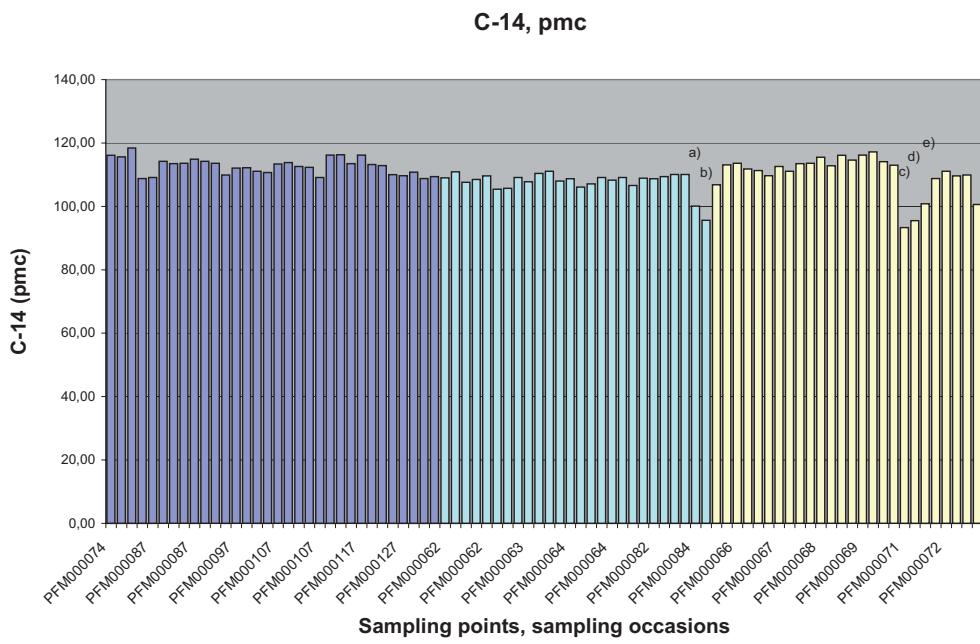

### 5.3.3 Trace metals

The results of the trace metal analyses from the time period March 2002 to March 2003 are compiled in Appendix 6.

### 5.3.4 Isotope determinations

The results of the isotope determination from the time period March 2002 to March 2003 are compiled in Appendix 5 (Deuterium, Tritium, <sup>18</sup>O, <sup>10</sup>B/<sup>11</sup>B, <sup>34</sup>S, <sup>37</sup>Cl, <sup>87</sup>Sr/<sup>86</sup>Sr, <sup>13</sup>C and <sup>14</sup>C pmc) and Appendix 7 (U-, Th-, Ra- and Rn isotopes).

The results of the Carbon-14 determinations (pmc = percent modern carbon) is given in the diagram in Figure 5-6. As can be seen, most of the samples show values well above 100%. Such high values indicate that the water has been in contact with the atmosphere after the atmospheric tests of nuclear bombs performed from about 1950 and onwards. Surface waters with a large proportion of precipitation will thus contain more than 100% pmc. Values below 100% may indicate discharge of groundwater.

**Figure 5-6.** Results of C-14 determinations. Blue colour = lake sample, turquoise colour = sea sample, yellow colour = streaming water sample

## 5.4 Quality of the analyses

### 5.4.1 Control analyses

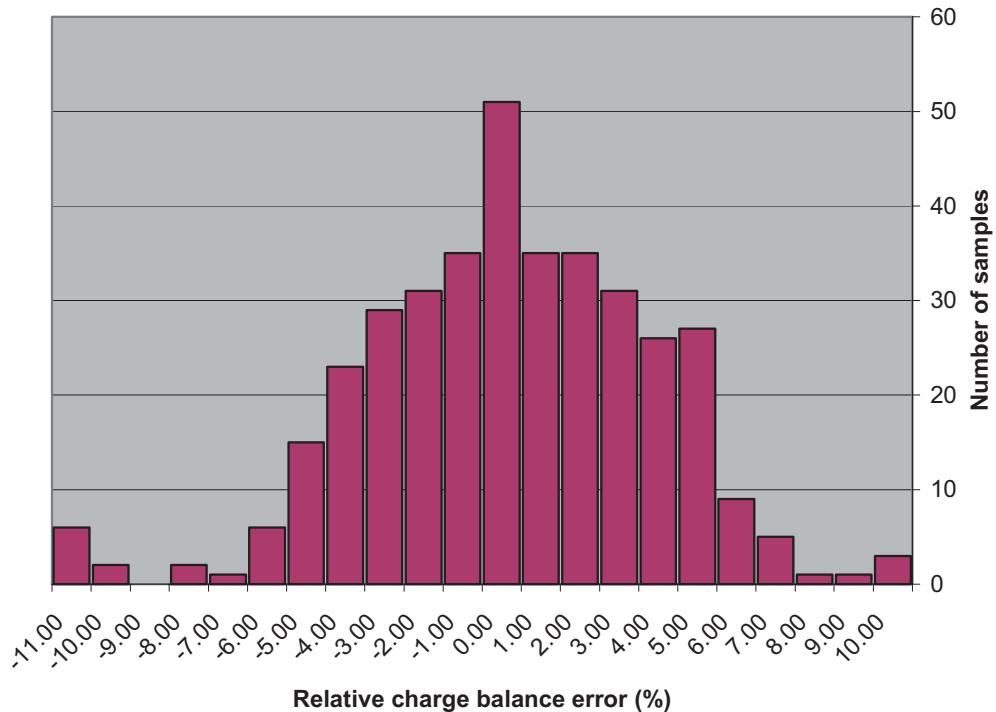

Comparison of results from different laboratories and methods demonstrate that in most cases the agreement is acceptable. Generally, the concentrations of each controlled component agree to within 10%, although this is to a large extent depending on the component in question and its concentration.

Two of the more important ordinary laboratories, i.e. Analytica (ICP) and Dept. of System Ecology, Stockholm University (nutrient salts etc) have better detection limits and show better accuracies compared to the controlling laboratories. The results from the controlling laboratories are in those cases regarded as less reliable than the corresponding results from the ordinary laboratory.

### 5.4.2 Charge balance errors

The charge balance errors give an indication of the quality and uncertainty of the analyses of the major components. The relative charge balance errors are calculated for the selected sets of data, see Appendix 3. The errors exceed  $\pm 10\%$  in 9 cases out of 374, if the incomplete data sets are excluded.

As can be seen from the diagram in Figure 5-7 the number of samples with excess of positive ions is slightly higher than those with a negative imbalance. Part of the explanation could be that the negatively charged organic acids are not included in the calculations of charge balance and may occasionally contribute with about 5% to the negative equivalents.

**Figure 5-7.** Distribution of ion charge balance errors. The number of samples is plotted versus the error range in percent. The total number of samples is 374.

## 6 Future work

The surface water sampling program in its present form is planned to proceed during two years. Later on the sampling is assumed to continue as a monitoring program. The experiences from this first year have resulted in some modifications for the coming year. The new program will be optimized for the two sciences, surface ecosystems and hydrogeochemistry, separately. The main outlines are listed below:

Surface ecosystems program:

- Includes mainly “biochemical” components, iodide and trace metals.
- Proceeds the sampling program with the same frequency as before.
- Reduces the sampling to include only the surface sample (0.5 m) except if the water is covered with ice. In those cases samples will also be collected from the bottom.

Hydrogeochemistry program:

- Includes major components, rare trace metals (as the lanthanoids) and isotopes.
- Reduces the frequency to four times a year (The extent of the analyses varies and the special and most expensive analyses are performed only once a year).
- Excludes C-13 and C-14 (pmc) isotope determinations the second year (except for a few sampling points where the obtained pmc values were found to be less than 100%, see Figure 5-5).
- Reduces the sampling to include only the surface sample (0.5 m) except if the water is covered with ice. In those cases samples will also be collected from the bottom.
- Reduces the sampling by omitting some points.

One year is a too short time to draw extensive conclusions but the data gained show some trends. As mentioned in Section 5.2 there is seldom any stratification of the water column. This fact is the main reason for bottom water samples to be excluded when ice is not present.

The measurement sonds have been used for some months, and at the time of writing an evaluation of the performance is proceeding. The evaluation includes investigations of some instrument defects appearing during the measurement period as well as analysis of the instrument quality. After completion of this work, it be decided if the same instruments should be used further on, or if other solutions should be considered.
